

## **I-75 South Corridor Master Plan**

I-75 from E of SR 951 (Collier Boulevard) to SR 78 (Bayshore Road)

### **Final - Existing Conditions Traffic Technical Memorandum**

November 2021

PREPARED FOR:

**FLORIDA DEPARTMENT OF TRANSPORTATION – DISTRICT ONE**

PREPARED BY:

**H. W. Lochner, Inc.**

FINANCIAL PROJECT IDENTIFICATION (FPID) NO. 442519-1-12-01

ETDM No. 14400

The Florida Department of Transportation may adopt this planning product into the environmental review process, pursuant to Title 23 U.S.C. § 168(d)(4), or to the state project development process.

# 1.0 Introduction

## 1.1 Project Description

The Florida Department of Transportation (FDOT) is preparing a Master Plan to address the operational capacity of I-75 from east of Collier Boulevard (SR 951) in Collier County to Bayshore Road (SR 78) in Lee County in order to accommodate future travel demand as a result of population and employment growth along the corridor.

As part of Florida's Strategic Intermodal System (SIS) highway network, I-75 plays a significant role in facilitating business, commuter, visitor, and freight traffic within the state. I-75 also serves as part of the emergency evacuation route network designated by the Florida Division of Emergency Management. I-75 is designated as a primary evacuation route for Collier and Lee Counties. The corridor is vital in facilitating traffic during emergency evacuation periods as it connects to other major arterials and highways of the evacuation route network [such as SR 951 (Collier Boulevard) and SR 78 (Bayshore Road)]. **Figure 1-1** shows the project location map for the I-75 Master Plan and this *Existing Conditions, Microsimulation and Calibration Technical Memorandum*.

## 1.2 Project Background

I-75 from east of Collier Boulevard (SR 951) to Bayshore Road (SR 78) Master Plan is part of FDOT District One's *Southwest Connect Projects* initiative to improve and/or provide managed lanes on the interstate system throughout much of District One. The other two project segments include the Interstate 4 (I-4) from West of SR 570 (Polk Parkway) to West of US 27 and the Interstate 75 (I-75) North Corridor from North River Road to Moccasin Wallow Road.

These three studies analyze the existing and expected future traffic (i.e. demand) on the interstate system and provide a regional perspective to identify the areas where future demand is predicted. The improvements identified in these studies may include widening, modifying interchanges, and evaluating requests for new interchanges.

The improvements proposed on I-75 from east of SR 951 (Collier Boulevard) to SR 78 (Bayshore Road) are identified in the FDOT's SIS Fiscal Year (FY) 2020/21 - FY 2024/25 First Five-Year Plan for the Planning and Project Development and Environment (PD&E) phases and the SIS Long Range Cost Feasible Plan FY 2029 - FY 2045 for the Preliminary Engineering and Right-of-Way (ROW) phases. This project is also included within the FY 2021 - FY 2026 FDOT Five-Year Work Program and the FY 2020/21 - FY 2023/24 FDOT State Transportation Improvement Program (STIP) with funding allocated for the Planning and PD&E phases. The project segment within Collier County [from North of Golden Gate Parkway to the Collier/Lee County Line] is identified as cost feasible in Collier County's Long Range Transportation Plan (LRTP) ("Collier 2045"). The full Collier County project segment is within the Collier Metropolitan Planning Organization's (MPO's) FY 2021 - FY 2025 Transportation Improvement Program (TIP) with funding allocated for the PD&E phase. In addition, the project segment within Lee County is listed in the FY 2020/21 - FY 2024/25 Lee County MPO's TIP with funds allocated to the Master Plan. The project is also included in the Lee County 2045 LRTP as a cost feasible project.

Figure 1-1 Project Location Map

### 1.3 Purpose and Need

The purpose of this PD&E project is to address the deficient operational capacity of I-75, also known as Florida's State Road (SR) 93, from east of Collier Boulevard (SR 951) in Collier County to Bayshore Road (SR 78) in Lee County in order to accommodate future travel demand projected as a result of population and employment growth along the corridor. The capacity deficiency is not existing but is expected to occur before the design year. The project will evaluate the potential addition of managed lanes, including supporting additional general-use lanes, collector-distributor roadways, and auxiliary lanes. Interchange operational improvements within the project limits will also be considered.

Other goals of the project are to:

1. Preserve the operational integrity and regional functionality of I-75 (and, therefore, the regional transportation network) by complementing similar corridor improvements to the north and
2. enhance emergency evacuation and response times.

The need for this project is based on the following criteria:

#### CAPACITY:

The project is anticipated to improve traffic operations along I-75 by increasing capacity and better dispersing traffic (i.e., separating managed lanes traffic from general use traffic). The traffic dispersal and reduced congestion can decrease vehicle conflicts and, therefore, enhance travel conditions in the corridor. I-75 within the project limits currently operates at Level of Service (LOS) A to C, within annual average daily volumes ranging from 43,500 vehicles per day to 102,000 vehicles per day. Traffic volumes on the corridor are projected to increase to between 66,000 and 155,000 vehicles per day by 2045. Without improvements, the driving conditions will deteriorate below acceptable LOS targets.

#### SAFETY:

I-75 serves as part of the emergency evacuation route network designated by the Florida Division of Emergency Management. Also designated as an evacuation facility of Collier and Lee Counties, I-75 is vital in facilitating traffic during emergency evacuation periods, connecting vehicles to other major arterials and highways of the state evacuation route network [such as SR 951 (Collier Boulevard) and SR 78 (Bayshore Road)]. The project is anticipated to:

- Improve emergency evacuation capabilities by enhancing connectivity and accessibility to other major arterials designated on the state evacuation route network
- Increase the volume of traffic that can be evacuated during an emergency event
- Allow for enhanced emergency access and incident response times due to the ability to maintain operational speeds within the managed lanes.

#### SYSTEM LINKAGE:

As part of Florida's Strategic Intermodal System (SIS) highway network, I-75 plays a significant role in facilitating commuter, visitor, and freight traffic within the state. The proposed project improvements are part of a larger, regional set of projects on the interstate system to the north (in Charlotte, Sarasota, Manatee, Hillsborough, Pinellas, and Polk Counties) that are considering managed lanes and

additional general purpose lanes, auxiliary lanes, etc. to increase the operational capacity of not only I-75 but I-4 and I-275 as well.

The intent is for all of these project improvements to work together to improve the overall reliability and performance of the interstate system in moving high volumes of goods and people at efficient speeds. It is important to note that managed lanes also create an opportunity for the provision of efficient and reliable transit service. As such, these improvements are critical to enhancing regional mobility. They are also key in preserving the operational integrity and regional functionality of the I-75 corridor as a whole.

## 1.4 Study Methodology

This Existing Conditions, Microsimulation and Calibration Technical Memorandum has been prepared in accordance with the approved Traffic Methodology Statement for this project submitted to FDOT in April 2020, the Safety Methodology Statement for this project submitted to the FDOT in August 2019, and the Traffic Analysis Memorandum of Agreement (MOA). Copies of the Traffic Methodology Statement, Safety Methodology Statement, and Traffic Analysis MOA are provided in **Appendix A**, **Appendix B**, and **Appendix C**, respectively. The analysis years used in this project are as follows:

- Existing Year – 2019
- Opening Year – 2025
- Design Year – 2045

The study area of influence and study intersections are illustrated in **Figure 1-2**. A list of these intersections and associated ID numbers for use in the traffic figures in subsequent sections, is provided in **Table 1-1**. Approximately 42 miles of interstate, 15 interchanges, and 149 intersections/driveways have been analyzed for this Master Plan.

## 2.0 Roadway Characteristics

I-75, within the study limits, is a SIS highway corridor operating as a four-lane divided limited access facility east (south) of Collier Boulevard and a six-lane typical section west (north) of Collier Boulevard. Additionally, auxiliary lanes are provided between the Terminal Access Road and Daniels Parkway interchanges, the Lockett Road and Palm Beach Boulevard interchanges, and the Palm Beach Boulevard and Bayshore Road interchanges. I-75 is a major commuter and freight corridor serving as the main south-north highway facility across western Florida linking the greater Naples area to the south and the Fort Myers and Cape Coral areas to the north.

**Table 2-1** describes the roadway characteristics of I-75 and interchange cross streets within the study area. In addition, Palm Beach Boulevard and Dr. Martin Luther King Jr. Boulevard are designated as SIS highway corridors and Terminal Access Road is designated as a SIS highway connector.

Table 2-1 State Roadway Characteristics

Roadway	From	To	Roadway ID	Begin Milepost	End Milepost	Segment Length (mi)	Speed Limit (mph)	SHS	Functional Classification	Context Classification	Typical Section

## 3.0 Traffic Data Collection

### 3.1 Transportation System Data

Available existing traffic data for the I-75 mainline and ramps was obtained from FDOT District One. All other traffic data was determined using the procedures described below. Additional sources of information also included: Straight Line Diagrams (SLDs), Roadway Characteristic Inventory (RCI) Data, Florida Geographic Data Library (FGDL) Geographic Information System (GIS) Data, and FDOT Florida Traffic Online Database (2019).

### 3.2 Existing and Historical Traffic Data

Data collection for the Master Plan consists of information from various sources. The sources of information collected include: traffic count information, the latest five-years of crash history, StreetLight Insight origin-destination (OD) data, and the District One Regional Planning Model (D1RPM) 2015 and 2040 Cost Feasible Model.

#### 3.2.1 Traffic Counts

Traffic data collection occurred in February and March 2019. There were 37 72-hour bi-directional classification counts, 145 72-hour bi-directional volume counts, and 140 turning movement counts (TMCs) collected between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. The TMCs additionally include pedestrian, bicyclist, and truck volumes, as well as a peak hour volume summary per intersection. Traffic count data for the I-75 South Corridor Master Plan can be found in **Appendix D**.

#### 3.2.2 Field Data

Field visits were also conducted to collect information on existing driver behavior and congestion levels, and to verify signal phasing information such as protected/permitted left-turn operations, right-turn-on-red (RTOR) restrictions, phasing, etc. Existing signal plans and timing information for signalized intersections were obtained from Collier County and Lee County and can be found in **Appendix E**.

Additional field data was collected for microsimulation calibration of the OD matrices through StreetLight Insight. StreetLight Insight uses Big Data derived from navigation-Global Positioning System (GPS) data and other location-based data from connected cars, trucks, traffic apps, traffic counts, points of interest, and third-party aggregators to identify travel patterns and provide OD and travel time information.

#### 3.2.3 Crash Data

Crash data was obtained for the study area from the FDOT's Crash Analysis Reporting (CAR) Online and the University of Florida's Signal Four (S4) crash database for the five-year analysis period from 2013 to 2017 and can be found in **Appendix F**. The data collected includes the following: the number of crashes; the type and location of each crash; the road surface, weather, and lighting conditions of each crash; the number of fatalities and injuries; and the estimate of property damage and economic loss. Crash data was collected for the I-75 mainline from east of Collier Boulevard (SR 951) in Collier County to north of Bayshore Road (SR 78) in Lee County, as well as for each of the study corridors and study intersections.

## 4.0 Historical Crash Analysis

The following sections summarize the analysis of the historical crash data for the I-75 South Corridor Master Plan. Unless otherwise stated, the crash data analyzed is from 2013-2017. There was a total of 5,231 crashes involving 37 fatalities and 10,578 injuries. Analysis of the study area was broken out into 54 interstate segments, 71 ramp segments, 75 arterial segments, and 91 arterial intersections. Of the 54 I-75 interstate segments, seven (13 percent) have a crash rate that is significantly higher than the statewide average for similar roadway facilities. Additionally, one (1.3 percent) of the 75 arterial segments and 13 (14.3 percent) of the 91 arterial intersections contain a crash rate that is significantly higher than the statewide average. Further detail for each study interchange and intersection can be found in **Appendix G**.

### 4.1 Crash Rates

A summary of the statewide average crash rates by facility type from the CARS database is provided in **Table 4-1**. In order to identify locations of concern within the I-75 South Corridor Master Plan, high crash rate locations have been identified in **Table 4-2** for all interchanges in the study area. The determination of high crash rate locations was performed using the procedure detailed in the FDOT CARS User Manual to determine the level of confidence (i.e., the high crash confidence) that a location's crash rate is higher than the statewide average from the FDOT CARS database for 2013-2017 for a location's facility type. Locations with a high crash confidence of 95 percent or higher were determined to have a crash rate that is statistically significantly higher than the statewide average. These locations have an actual crash rate that is significantly higher than the statewide average, with a high crash confidence of 95 percent or higher. The interchanges that include high crash locations are discussed below in further detail. The ramp segments connecting the interstate to the arterial at each interchange do not have a statewide average crash rate associated with their facility type.

#### SR 951 (Collier Boulevard)/I-75 Interchange area:

Only the northbound I-75 segment at the off-ramp to Collier Boulevard has a crash rate that is significantly higher than the statewide average.

#### Golden Gate Parkway and Santa Barbara Boulevard/I-75 Interchange area:

Only the southbound I-75 segment at the Golden Gate Parkway on-ramp has a crash rate that is significantly higher than the statewide average.

#### Immokalee Road/I-75 Interchange area:

Five locations have a crash rate that is significantly higher than the statewide average, including Immokalee Road to the east and west of the Oakes Boulevard Exit and at the Northbrooke Drive and Valewood Drive intersections, as well as on the I-75 mainline at the southbound off-ramp.

#### SR 884 (Colonial Boulevard)/I-75 Interchange area:

Five locations have a crash rate that is significantly higher than the statewide average, including all four intersections, as well as northbound I-75 at the on-ramp from eastbound Colonial Boulevard.

#### SR 82 (Dr. Martin Luther King Jr. Boulevard)/I-75 Interchange area:

Four locations have a crash rate that is significantly higher than the statewide average, including the intersections at Ortiz Avenue, both ramp terminals, and Forum Boulevard.

### Palm Beach Boulevard)/I-75 Interchange area:

Two locations have a crash rate that is significantly higher than the statewide average, including the I-75 northbound ramp terminal intersection and northbound I-75 at the on-ramp from Bayshore Road.

### SR 78 (Bayshore Road)/I-75 Interchange area:

Four locations have a crash rate that is significantly higher than the statewide average, which include both ramp terminal intersections as well as both of the northbound and southbound I-75 mainline segments located at the off-ramps.

Table 4-1 Summary of Five-Year Statewide Average Crash Rates (2017) by Facility Type

Area Type	Average Crash Rate Category	Statewide Average Crash Rate
Urban	6+ Lanes 2wy Divided Raised	4.714
	Interstate	0.976
	6+ Lanes 2wy Divided Raised 4 Legs	0.884
	6+ Lanes 2wy Divided Raised 3 Legs	0.479
	4-5 Lanes 2wy Divided Raised 3 Legs	0.419
Suburban	6+ Lanes 2wy Divided Raised 4 Legs	0.749
	6+ Lanes 2wy Divided Raised 3 Legs	0.343
Rural	Interstate	0.457

Table 4-2 Locations with High Crash Ratios

Interchange/Roadway	Interchange/Roadway	Total Crashes	5-Year Average AADT	Actual Crash Rate	Statewide Average Crash Rate	High Crash Confidence	Confidence Level (K)
SR 951 (Collier Blvd)	Northbound I-75 Mainline at Off-Ramp	18	10,300	1.572	0.976	97.50%	2.19

	Intersection at I-75 Northbound Ramps	23	20,800	0.606	0.419	95.00%	1.91
	Southbound I-75 Mainline at Off-Ramp	20	25,500	0.805	0.457	99.50%	2.71
	Northbound I-75 Mainline at On-Ramp	19	25,200	0.735	0.457	97.50%	2.24

## 4.2 Crash Types

In general, rear-end crashes were the most common crash types at the high crash locations, including all of the high crash arterials and on the I-75 mainline at the Colonial Boulevard and Golden Gate Parkway interchanges. Fixed object crashes were generally the most common on the I-75 mainline, including at the Colonial Boulevard, Bayshore Road, and Palm Beach Boulevard locations. However, sideswipe crashes were the most common on I-75 at Collier Boulevard. **Table 4-3** details the total number of crashes at high crash locations separated by crash type.

Table 4-3 High Crash Location Common Crash Type

Interchange/Roadway	On Street Common Crash Type	Common Crash Type %	Common Crash Type Count	Total Crashes
I-75 Mainline at Collier Boulevard Interchange	Sideswipe	38.90%	7	18
I-75 Mainline at Golden Gate Parkway Interchange	Rear End	35.70%	10	28
Immokalee Road Surface Street	Rear End	58.10%	61	105
I-75 Mainline at Immokalee Road Interchange	Rear End	57.90%	44	76
Colonial Boulevard Surface Street	Rear End	69.20%	415	600
I-75 Mainline at Colonial Boulevard Interchange	Hit Fixed Object	40.00%	12	30
Dr. Martin Luther King Jr. Boulevard Surface Street	Rear End	62.20%	140	225
I-75 Mainline at Bayshore Road Interchange	Hit Fixed Object	33.30%	13	39
Bayshore Road Surface Street	Rear End	49.20%	31	63

## 4.3 Lighting, Weather, and Road Surface Conditions

Eighteen percent of crashes at high crash locations took place in wet/slick/unpaved and standing water roadway conditions, accounting for 224 total crashes. Five percent of crashes at high crash locations took place in dark conditions with no lighting, accounting for 61 total crashes. **Table 4-4** details the total number of crashes within the project area separated by roadway surface and lighting conditions.

Table 4-4 High Crash Location Contributing Factors Summary

Interchange/Roadway	Percent of Total Crashes at High Crash Locations		Total Crashes at High Crash Locations		Total Crashes at Interchange High Crash Locations
	In Dark – No Lights Conditions	In Wet/ Slick/Unpaved and Standing Water Road Surface Conditions	In Dark – No Lights Conditions	In Wet/ Slick/Unpaved and Standing Water Road Surface Conditions	
SR 951 (Collier Blvd)	17%	17%	3	3	18
Golden Gate Pkwy	11%	14%	3	4	28
Immokalee Rd	7%	17%	13	31	181
SR 844 (Colonial Blvd)	2%	19%	13	117	630
SR 82 (Dr. Martin Luther King Jr. Blvd)	4%	9%	8	20	225
SR 80 (Palm Beach Blvd)	8%	29%	7	27	93
SR 78 (Bayshore Rd)	14%	22%	14	22	102
<b>Total</b>	<b>5%</b>	<b>18%</b>	<b>61</b>	<b>224</b>	<b>1277</b>

#### 4.4 Injury Severity

**Table 4-5** summarizes crashes for all locations in study area by severity. Of the 5,231 total crashes, there were 34 fatal crashes 2,083 crashes involving personal injury, and 3,114 crashes that were property damage only. The FDOT KABCO crash costs from the FDOT Florida Design Manual (FDM) 2020 edition are summarized in **Table 4-6**.

Table 4-5 Crash Severity Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Fatal	5	4	7	9	9	34	6.8	0.60%
Severe Injury	30	29	21	34	38	152	30.4	2.90%
Moderate Injury	129	137	150	142	126	684	136.8	13.10%
Minor Injury	197	238	236	302	274	1247	249.4	23.80%
Property Damage Only	482	556	659	706	711	3114	622.8	59.50%
<b>Total</b>	<b>843</b>	<b>964</b>	<b>1073</b>	<b>1193</b>	<b>1158</b>	<b>5231</b>	<b>1046.2</b>	<b>100.00%</b>

Table 4-6 FDOT KABCO Crash Costs

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$10,670,000
Severe Injury (A)	\$872,612
Moderate Injury (B)	\$174,018
Minor Injury (C)	\$106,215
Property Damage Only (O)	\$7,700

**Table 4-7** summarizes crash severity and comprehensive crash cost by location for high crash locations. Overall, there were eight fatal crashes, 27 severe injury crashes, 152 moderate injury crashes, 361 minor injury crashes, and 729 property damage only crashes. These crashes had an estimated comprehensive crash cost of \$179,328,175, which is an average of \$35,865,635 per year.

The average cost per crash at each location was calculated by dividing the total KABCO crash cost by the total crashes. This was then compared to the statewide average cost per crash based on the FDOT Average Crash Costs by Facility Type Table 122.6.1 from the FDOT Design Manual 2020. These tables and the summary of the statewide average cost per crash are included in **Appendix G**. Overall, five locations had costs per crash higher than the statewide average. The location-specific average cost per crash of these locations is shown in red in the tables below. The location with the highest comprehensive crash cost was the Colonial Boulevard at Ortiz Avenue/Six Mile Cypress Parkway, with an estimated total five-year crash cost of \$40,363,962. The location with the highest average cost per crash was Immokalee Road at Northbrooke Drive/Tarpon Bay Boulevard, with an average cost per crash of \$450,019.

Table 4-7 Crash Severity for High Crash Locations

Interchange	Interchange/Roadway	Fatal	Severe Injury	Moderate Injury	Minor Injury	Property Damage Only	Total Crashes	Total Crash Cost	Location Average Cost Per Crash	State Average Cost Per Crash

## 4.5 Contributing Causes

A summary of crashes by driver contributing cause for the high crash locations is shown in **Table 4-8**. Among the contributing causes documented in the crash data, careless/negligent driving (381 crashes, 29.8 percent) and following too closely (285 crashes, 22.3 percent) were among the highest.

Table 4-8 Contributing Causes for High Crash Locations

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Careless/ Negligent Driving	64	70	68	92	87	381	76.2	29.80%

## 5.0 Multimodal Accommodations

### 5.1 Pedestrian and Bicyclists

Currently, sidewalks are provided along the following corridors within the study area:

- Only on the west side of Collier Boulevard south of the Golden Gate Main Canal bridge;
- The entirety of Davis Boulevard, Radio Road, and Santa Barbara Boulevard;
- The entirety of Golden Gate Parkway;
- The entirety of Pine Ridge Road west of Whippoorwill Lane and east of Napa Boulevard, but only along the north side of the roadway between Whippoorwill Lane and Napa Boulevard;
- The entirety of Vanderbilt Beach Road;
- Only on the south side of Immokalee Road, due to the north side of the roadway containing guardrails right up against the curb as protection from a drainage ditch;
- The entirety of Bonita Beach Road SE west of Hunters Ridge Boulevard/Millers Road, but only on the south side of the roadway east of Hunters Ridge Boulevard/Millers Road;
- The entirety of Corkscrew Road west of Stoneybrook Golf Boulevard/Ben Hill Griffin Parkway, but only on the south side of the roadway east of Stoneybrook Golf Boulevard/Ben Hill Griffin Parkway;
- The entirety of Alico Road;
- The entirety of Daniels Parkway;
- The entirety of Colonial Boulevard;
- The entirety of Dr. Martin Luther King Jr. Boulevard;
- Only on the south side of Lockett Boulevard east of the I-75 interchange; and
- The entirety of Palm Beach Boulevard.

Bicycle lanes are provided along the following corridors within the study area:

- Collier Boulevard south of the Golden Gate Main Canal bridge;
- The entirety of Davis Boulevard, Radio Road, and Santa Barbara Boulevard;
- Golden Gate Parkway west of 55th Street SW;
- The entirety of Vanderbilt Beach Road;
- Bonita Beach Road SE west of the I-75 interchange;
- Corkscrew Road east of Corkscrew Woodlands Boulevard;
- The entirety of Alico Road;
- Daniels Parkway west of Danport Boulevard; and
- The entirety of Dr. Martin Luther King Jr. Boulevard.

All remaining segments and corridors that are not mentioned above do not provide pedestrian and/or bicycle accommodations. Marked crosswalks are provided at all signalized intersections within the study area, providing at least one crosswalk in the east/west direction and at least one crosswalk in the north/south direction, except for the following:

- The I-75 and Collier Boulevard interchange does not provide east/west crosswalks across Collier Boulevard.
- The Collier Boulevard and Golden Gate Parkway intersection does not provide east/west crosswalks across Collier Boulevard. However, the east side of the roadway contains guardrails

at the curb as protection from a drainage ditch, and therefore is not able to provide a sidewalk on the east side of the roadway.

- The I-75 and Golden Gate Parkway interchange does not provide north/south crosswalks across Golden Gate Parkway.
- The I-75 and Pine Ridge Road interchange does not provide north/south crosswalks across Pine Ridge Road.
- The I-75 and Immokalee Road interchange does not provide north/south crosswalks across Immokalee Road.
- The I-75 and Corkscrew Road interchange does not provide north/south crosswalks across Corkscrew Road.
- The I-75 and Alico Road interchange does not provide north/south crosswalks across Alico Road.
- The I-75 and Daniels Parkway interchange does not provide north/south crosswalks across Daniels Parkway.
- The I-75 and Colonial Boulevard interchange does not provide north/south crosswalks across Colonial Boulevard.
- The I-75 and Dr. Martin Luther King Jr. Boulevard interchange does not provide north/south crosswalks across Dr. Martin Luther King Jr. Boulevard.
- The Lockett Road and Hamilton Drive/Enterprise Parkway intersection does not provide east/west crosswalks across Hamilton Drive/Enterprise Parkway.
- The I-75 and Palm Beach Boulevard interchange does not provide north/south crosswalks across Palm Beach Boulevard.
- The I-75 and Bayshore Road interchange does not provide east/west or north/south crosswalks across the I-75 ramps or Bayshore Road.

There are no mid-block crosswalks or pedestrian bridges within the entire study area.

## 5.2 Transit

The Lee County Transit Service (LeeTran) provides bus services throughout much of the study area in Lee County. The following bus routes are provided along the following study corridors:

- Route 5 provides connection from Edison Mall to Forum Boulevard via Ortiz Avenue, Dr. Martin Luther King Jr. Boulevard, Destination Drive, Forum Boulevard, and Colonial Boulevard.
- Route 50 provides connection from the Southwest Florida International Airport to the Sanibel Outlets via Daniels Parkway, Treeline Avenue, and Terminal Access Road.
- Route 60 provides connection from San Carlos Park to the Gulf Coast Town Center via Three Oaks Parkway, Corkscrew Road, Ben Hill Griffin Parkway, and Alico Road.
- Route 100 provides connection from the Rosa Parks Transportation Center to Riverdale via Palm Beach Boulevard.
- Route 110 provides connection from Edison Mall to Lehigh Acres via Colonial Boulevard.

Additionally, Collier Area Transit (CAT) provides the following bus services along the following study corridors in Collier County as well:

- Route 15 provides connection from the Government Center to CAT and Golden Gate City via Radio Road, Santa Barbara Boulevard, and Golden Gate Parkway.

- Route 16 provides connection from the Government Center to CAT and Golden Gate City via Radio Road, Santa Barbara Boulevard, and Golden Gate Parkway.
- Route 19 provides connection from Government Center to CAT and Immokalee, Florida via Radio Road, Davis Boulevard, and Collier Boulevard.
- Route 20 provides connection from CAT to Magnolia Square via Pine Ridge Road, Santa Barbara Boulevard, Davis Boulevard, and Radio Road.
- Route 25 provides connection from CAT to the Coastland Center and Magnolia Square intersection via Radio Road, Davis Boulevard, Collier Boulevard, and Golden Gate Parkway.
- Route 26 provides connection from Parkway Plaza to Clam Pass Park via Logan Boulevard, Vineyards Boulevard, Napa Boulevard, and Pine Ridge Road.
- Route 27 provides connection from Golden Gate Center to Arthrex via Immokalee Road, Collier Boulevard, and Golden Gate Parkway.
- Route 28 provides connection from the Government Center to CAT and Immokalee, Florida via Radio Road, Davis Boulevard, and Collier Boulevard.
- Route 121 provides express connection from Marco Island, Florida to Immokalee, Florida via Collier Boulevard and I-75.

The Lee County Transit (LeeTran) and Collier Area Transit (CAT) existing transit line maps are shown in **Appendix H**.

## 6.0 Existing Year (2019) Volume Development

The following sections summarize the development of the Existing Year (2019) traffic volumes for the I-75 South Corridor Master Plan. Further detail for each study interchange and intersection can be found in **Appendix I**.

### 6.1 Design Traffic Factors

Design traffic factors were determined for the I-75 South Corridor Master Plan based on the collected traffic data, historically observed factors, and forecasted factors from the D1RPM v1.0.6, with base year 2015 and horizon year 2040 and validated by FDOT for the subarea. The factors were developed based on the procedures outlined in the *FDOT Project Traffic Forecasting Handbook, 2019*. **Table 6-1** and **Table 6-2** summarizes the existing traffic characteristics and recommended design traffic factors, respectively. These values were used in the development of the Existing Year (2019) design hour volumes.

### 6.2 Methodology

The following summarizes the steps that were taken to convert the Existing Year (2019) AADT for the I-75 South Corridor Master Plan to Existing Year (2019) turning movement volumes. Further detail can be found in the Traffic Methodology Statement in **Appendix A**.

1. Seasonal and axle correction factors were obtained from FDOT *Florida Traffic Online* (2019) and applied to the 48-hour and 72-hour counts to obtain Existing Year (2019) AADT for the surface streets. AADTs from FDOT *Florida Traffic Online* (2019) were directly used for the I-75 mainline. **Figure 6-1** through **Figure 6-15** show the Existing Year (2019) AADT volumes for the I-75 South Corridor Master Plan.
2. The recommended K-factor and D-factors were then applied to the AADTs to determine directional design hour volumes (DDHVs) for each of the external nodes of the study area. Based on a review of the field data, a standard K-factor of 0.09 were used on I-75 and arterial roadways. Field collected peak-to-daily ratios are used for driveways and minor non-arterial roads. **Table 6-1** provides interchange level average peak-to-daily ratios as a point of reference; however individual count locations may differ particularly on these smaller roadways. The D-factors, as presented in **Table 6-2**, are generally constrained to the maximums provided in the *FDOT Project Traffic Forecasting Handbook, 2019* however field collected counts exceeding these maximum values are used for driveways and minor non-arterial roads.
3. The external DDHVs were used, along with a base OD matrix from the base year 2015 D1RPM, as inputs to the TFlow Fuzzy demand matrix adjustment methodology of PTV Visum, along with seasonally adjusted field collected turning movement counts (TMCs), to determine the Existing Year (2019) turning movement volumes (TMV). The existing TMCs from the data collection effort were used as targets within the Visum network. This method balances the unbalanced field collected volumes.
4. The resulting output from Visum was a balanced, system-wide, OD matrix that replicates the Existing Year (2019) turning movement volumes discussed in the following section. The OD matrix served as a direct input into the static routing functionality of Vissim.

### 6.3 Existing Year (2019) Turning Movement Volumes

Based on the above methodology, the AM and PM peak hours were determined to occur from 7:15 AM to 8:15 AM and from 4:45 PM to 5:45 PM, respectively. **Figure 6-16** through **Figure 6-30** show the Existing Year (2019) peak hour turning movement volumes for the I-75 South Corridor Master Plan.

For the microsimulation of the I-75 South Corridor study area, three hours of traffic simulation were modeled for each AM and PM peak period, as well as a one-hour network loading interval. The three-hour simulation periods were broken up into 15-minute intervals, consisting of one hour for startup, one hour for the peak, and one hour for dissipation of the peak. The network loading, startup, and dissipation volumes were determined as a proportion of the peak hour volumes based on the collected 72-hour approach counts.

Table 6-1 Existing Traffic Characteristics

Traffic Factor	Interchange/Roadway	AM Peak Hour	PM Peak Hour
Peak Hour Factor	Collier Boulevard	0.95	0.95
	Santa Barbara Boulevard	0.90	0.95
	Golden Gate Parkway	0.92	0.96

## 7.0 Simulation Model Development

### 7.1 Methodology

The existing conditions simulation models for the study area were developed using Vissim version 2020 (service pack 10), a widely used behavior-based multi-purpose traffic microsimulation program. Vissim tracks individual vehicle movements and interactions with more detail than typical Highway Capacity Manual (HCM) methods and quantifies the performance of individual movements and overall delays and queue lengths for freeways, ramps, and intersections. The 2019 update of FHWA's *Traffic Analysis Toolbox Volume III: Guidelines for Applying Traffic Microsimulation Modeling Software* and the 2014 FDOT *Traffic Analysis Handbook* were used as a guideline for the development and calibration of the project Vissim models.

Given the size of the study area and the number of interchanges included for analysis, subarea Vissim models were developed and calibrated for each interchange area and the I-75 mainline and ramps using the calibration measures discussed in **Section 8.2**. The calibrated subarea models were merged into a single model by combining the individual interchange models with the I-75 mainline model. The combined model was verified for calibration and then used for the analysis of existing conditions. Model assumptions, parameters, and network coding techniques are discussed in the following subsections. All assumptions are based on the traffic data collected in the field in February and March 2019. Additional site visits were conducted in November 2019 to verify network elements and to observe general driver behavior and localized calibration parameters.

### 7.2 Data Inputs

Multiple data sources were used to develop the data inputs and calibration targets used in the existing conditions Vissim models. Raw traffic counts were adhered to as closely as possible for calibration. This adherence to the true measured counts provides a more reasonable expectation that other field measurements can be replicated in the model. Detailed information on the development of traffic volumes for calibration and analysis is provided in **Section 6.0**. Traffic counts, signal timing plans, and spot speeds were used for model inputs. Measured travel times (arterial), traffic counts, and spot speeds (I-75) were used to compare with calibration targets. In general, pedestrian, bicycle, and transit components were not modeled unless required for calibration (see **Section 8.0**).

### 7.3 Model Geometrics

Scaled aerial photography obtained from the Land Boundary Information System (LABINS) and Aerial Photo Look Up System (APLUS) was utilized to develop the base Vissim network and establish intersection lane configurations, stop bar locations, and turn bay lengths. The high-resolution aerials were also used to accurately code merge, weave, and diverge sections on the I-75 mainline according to the lane striping. The geometry was verified using online mapping services, particularly in cases where there appeared to be recent construction.

### 7.4 Vehicle Inputs

Balanced traffic volumes were summarized in 15-minute intervals using existing count data in order to represent the traffic fluctuations during simulated peak periods, which allowed the Vissim models to more closely represent traffic arrival patterns and queuing on the mainline and arterial intersections. Global peak hours of 7:15 AM to 8:15 AM and 4:45 PM to 5:45 PM were determined for

the study area. The Vissim models included a one-hour shoulder period before the peak hour and a one-hour shoulder period after the peak hour. A one-hour seeding period was used prior to the start of the first shoulder hour. The seeding period allows for vehicles to be loaded into the network before recording simulation results.

## 7.5 Traffic Composition

Traffic compositions (car and truck percentages) for calibration were derived from existing count data for all arterial model inputs. Truck percentages on the primary interchange arterial inputs ranged from 1 to 10 percent, except for westbound Alico Road, which has 40 percent trucks during the AM peak period. Truck percentages on the I-75 mainline inputs were calculated following FDOT guidelines, which assumes that peak period truck percentages are half of the daily truck percentage. The peak period truck percentages for I-75 were five percent in the northbound direction and six percent in the southbound direction. Traffic compositions varied slightly between the calibration and seasonally adjusted volumes used for analysis. Truck percentages used for analysis ranged from 1 to 12 percent on the primary arterial inputs (with westbound Alico Road at 36 percent) and were five and eight percent for northbound and southbound I-75, respectively.

## 7.6 Vehicle Routing

Traffic patterns in Vissim were modeled using static routes and routing decisions. Vehicle routing through the study area was achieved through the development of OD matrices. The OD matrices were developed in 15-minute intervals over a 24-hour period for both cars and trucks using temporal distributions from existing tube counts. Separate routing decisions were modeled for each vehicle class (car and truck) based on the different OD matrices and included 15-minute static route volumes for the entire 4-hour AM and PM peak period. Each of the interchange and mainline subarea Vissim models included separate OD matrices that were tied together at the on- and off-ramps when combined into the larger model.

## 7.7 Speed Distributions

Speed distribution profiles were developed for I-75 based on weekday (Tuesday-Thursday) off-peak spot speed data collected from the Regional Integrated Transportation Information System (RITIS). The average spot speed data was used to develop speed profiles per lane along the entire I-75 corridor, particularly between interchanges and near locations with observed reductions in speed due to roadway geometry. The use of per lane speed distributions allowed the Vissim models to more accurately represent field conditions, which included speed differences of 10 miles per hour (mph) or more between lane 1 (slow lane) and lane 3 (fast lane) based on the RITIS data. A total of 43 speed profiles were developed for northbound and southbound I-75 from south of Collier Boulevard to north of Bayshore Road.

In general, speed limits were used to define the speed distributions on all other roadways within the study area. The speed distributions on the arterials were based on data from previous studies for similar roadway types. Desired speed distributions used in the Vissim models are shown below in **Table 7-1**. With over 40 different speed profiles used on the I-75 mainline, an example distribution for one location has been provided. Desired speed decisions were used in the models to generate desired vehicle speeds at various roadway segments and reduced speed areas were strategically placed in locations where vehicles need to reduce their speed due to roadway alignment or for turning movements at intersections. Separate desired speed decisions and reduced speed areas were applied

for both cars and trucks, with truck speeds generally slower than cars. Where applicable, turning movements with two or more lanes also included different speeds per lane for both cars and trucks due to the tighter turning radius on the inside lane versus the outside lane.

Table 7-1 Vissim Speed Distributions

Facility or Speed Function	Posted Speed (mph)	Minimum Speed (mph)	Median Speed (mph)	Maximum Speed (mph)
20 mph	20	18	20	27
25 mph	25	20	27	43
30 mph	30	22	30	46
35 mph	35	24	33	50
40 mph	40	29	39	55
45 mph	45	33	43	57
50 mph	50	37	48	61
55 mph	55	42	53	66
60 mph	60	47	57	67
65 mph	65	45	64	77
70 mph	70	54	68	81
Reg Right Turns	-	9	-	12
Sharp Right Turns	-	6	-	9
Wide Right Turns	-	15	-	19
Reg Left Turns	-	15	-	19
Sharp Left Turns	-	10	-	13
Wide Left Turns	-	17	-	22
U-Turn	-	5	-	8
<b>I-75 Mainline Per Lane Example (Northbound MP 106.8)</b>				
Lane 1	70	56	70	85
Lane 2	70	63	73	85
Lane 3	70	67	78	89

Desired speed decisions from the calibrated existing conditions models will be carried forward to the future year models in areas with existing geometry and new speed decisions will be added where geometric improvements include additional lanes. In general, additional through lanes will utilize the same desired speed decisions as the existing left-most lane and auxiliary lanes will utilize the desired speed decisions from the existing right-most lane. If the existing ramp geometry is modified under future conditions, any desired speed decisions near the ramps will be shifted relative to the gore point. Desired speed decisions for new roadways (CD roads and/or express lanes) will be based on the proposed posted speed.

### 7.8 Lane Change and Emergency Stop Distance

The look-back or lane change distance defines the distance at which vehicles attempt to change lanes prior to a decision point. The longer the distance, the farther back the driver anticipates their next movement, thus impacting lane utilization. For example, drivers on a dual left-turn lane will position themselves based on a downstream turning movement or vehicles will position themselves in the right-hand lane upstream of an interchange entrance ramp. Lane change distances were initially set to a

value of 1,500 feet for arterials and adjusted, where necessary, to match field conditions and calibrate congestion levels. Lane change distances for I-75 off-ramps ranged from 2,500 feet to over two miles. Known decision making patterns and engineering judgment were also used to modify the look-back distances as needed.

Emergency stop is the last possible position where a vehicle can change lanes. The default value in Vissim for emergency stop distance is 16.4 feet, which was increased to 50 feet for arterials and 150 feet for I-75 off-ramps to allow enough space for vehicles to make decisions prior to being too close to an intersection or diverge location, especially at higher speeds. Similar to the lane change distances, emergency stop distances were adjusted, where necessary, to match field conditions and calibrate congestion levels.

## 7.9 Signal Operations and Stop/Yield Control

Signal timing and phasing parameters were coded in the AM and PM models using Vissim's ring barrier controller (RBC) module according to the signal timing plans obtained from Lee County and Collier County. All intersections were coded with an individual signal controller except for when an interchange operates both ramp terminals using a single controller. The modeling assumed that RTOR was allowed on all right turns unless they were specifically prohibited with the use of no RTOR signs. Additionally, RTOR was only allowed from the right-hand lane of a dual or triple right-turn movement consistent with field observations unless modified for calibration purposes.

Stop or yield control was coded in the model for unsignalized intersections using a combination of stop signs, conflict areas, or priority rules depending on signage and/or driver behavior. In general, priority rules were used for permitted left-turn movements due to Vissim's inability to properly handle conflicts with both the opposing through lanes and right-turn lane using only conflict areas. Depending on the geometry, Vissim will create two conflict areas and a left-turning vehicle will yield to the opposing through traffic and then yield again if a right-turning vehicle is present at the same time, resulting in the left-turning vehicle yielding in the middle of the through lanes. The use of priority rules provided more control over these conflicting movements and allowed the left-turn movement to properly yield for the opposing right-turn movement.

In addition, conflict areas were used at these locations to prevent through vehicles from running over left-turning vehicles. The use of conflict areas allowed the through traffic to "slow down" for vehicles that may sometimes make an aggressive left turn, or for trucks that are slow to cross the through lanes. The use of priority rules and conflict areas for permitted turns provided a consistent approach across all locations.

## 7.10 Multiple Model Runs and Simulation Output

Due to the varying nature of the simulations between runs with different random seed numbers, Vissim results can differ from one run to the next. To improve model accuracy, multiple runs are required, and the results should be calculated using an average of these runs. Following the guidelines provided in Section 7.4 of the FDOT Traffic Analysis Handbook, the following equation was used to determine the minimum number of runs:

$$n = \left( \frac{s * t_{\frac{\alpha}{2}}}{\mu * \varepsilon} \right)^2$$

Where:

$n$  = required number of simulation runs

$s$  = standard deviation of the system performance measure (such as total traffic volume) based on previously conducted simulation runs.

$t_{\alpha/2}$  = is the critical value of a two-sided student's  $t$ -statistic at the confidence level of  $\alpha$  and  $n-1$  degrees of freedom. An  $\alpha$  of 5% is typical.

$\mu$  = mean of the system performance measure

$\varepsilon$  = the tolerable error, specified as a fraction of  $\mu$ . A 10% error is desired.

The equation noted above resulted in less than one model run, therefore a minimum of ten runs were performed for the calibration and existing conditions models, with random seed numbers ranging from 1111 to 11110 with increments of 1111.

## 8.0 Simulation Model Calibration

Calibration is an iterative process that involves adjusting model parameters until the simulation reasonably replicates driver behavior, traffic flow patterns, and field-measured data. The calibration process used for the Vissim models followed FDOT and FHWA guidelines for determining the acceptability of model results as compared to existing operations.

### 8.1 Visual Checking and Error Correction

The visual checking and error correction process focused on addressing coding errors before the output results were compared to the calibration targets. When making changes to model parameters, error checking reduces the potential that these changes have unintended consequences in the model. This process involved reviewing data inputs, Vissim error reports, and model animations. Data inputs, such as network geometry, traffic volumes, and route choices, were reviewed by the model developer as well as a quality control reviewer. The error report produced after each simulation run may include common errors, such as vehicle removal, signal errors, end-of-link errors, and various other reasons. Critical errors in the model were accounted for and corrected during this step.

Reasonableness checks included visual checking of the animation file to check for abnormal driving behavior or irregular queuing within the network and to identify coding parameters that may have been overlooked. Additionally, modeled throughput was compared to the demand volumes to eliminate large differences between demand and modeled volumes.

### 8.2 Calibration Targets

The objective of model calibration is to match model performance to the field performance measurements with a predetermined threshold of acceptable error. This allowable error accounts for limitations in software capabilities and the realization that traffic data and field observations collected on different days will naturally yield different results due to normal fluctuations in traffic patterns. Calibration of the existing AM and PM peak period subarea and combined models used the thresholds indicated in the FDOT *Traffic Analysis Handbook*, Table 7-7 Classical Model Calibration Targets shown in **Table 8-1**.

Traffic volume calibration targets include the Gregory E. Hovers (GEH) statistic, which compares expected or measured volumes with volume output from the microsimulation model and is calculated using the following formula:

$$GEH = \sqrt{\frac{2(m - c)^2}{m + c}}$$

Notes:

*m* = Model estimated traffic volume from the simulation model, vehicles per hour (vph)

*c* = Field measured traffic volume, vph

Using GEH instead of difference percentages allows for a better acceptance over a wider range of volumes. GEH is not linear and places less importance on links with low expected volumes while allowing for variation at high volume locations. Typically, a GEH of less than 5.0 is considered a good match between the two compared hourly volumes for the same facility. GEH values higher than 5.0 warrant investigation and values over 10.0 indicate there may be an error with the model.

Table 8-1 Vissim Calibration Targets

Calibration Criteria	Calibration Target/Goal
Traffic Volume	Simulated and measured link volumes for more than 85% of links to be: <ul style="list-style-type: none"> <li>• Within 100 vph for volumes less than 700 vph</li> <li>• Within 15% for volumes between 700 vph and 2700 vph</li> <li>• Within 400 vph, for volumes greater than 2700 vph.</li> </ul>
	Simulated and measured link volumes for more than 85% of links to have a GEH statistic value of 5 or lower.
	Sum of link volumes within calibration area to be within 5%.
	Sum of link volumes to have a GEH statistic value of 5 or lower.
Speed	Modeled average speeds on I-75 to be within +/- 10 mph of field-measured speeds on at least 85% of all RITIS detector locations.
Travel Time	Modeled arterial travel times within 1 minute (or 15%, if higher) for more than 85% of segments.
Visualization	Check consistency with field conditions of the following: on- and off-ramp queuing; weaving maneuvers; patterns and extent of queue at intersections and congested links; lane utilization/choice; location of bottlenecks; etc.
	Verify no unrealistic U-turns or vehicles exiting and reentering the network.

### 8.3 Freeway Calibration Parameters

The primary freeway calibration parameters included driver behavior parameters related to car following and lane changing as well as connector look-back distances. Ultimately, the driver behavior directly relates to the capacity of the links with which they are associated. For lower capacity sections, more conservative driver behavior parameters are used, and for higher capacity sections, more aggressive driver behavior. The driving behavior parameters for each type were varied to allow for increased headways, improved lane change (ramp merge cooperation) behavior, and overall driver aggressiveness. Additional freeway calibration parameters included per lane speed distribution profiles, as previously discussed, and lane utilization near high-volume ramp merges. A total of 14 link/driver behavior types were developed to model the freeway segments.

For all freeway driving behaviors, the Wiedemann 99 car following model was used. Low, mid, and high-capacity driver behavior parameters were developed for basic freeway, merge, diverge, and weave areas to achieve calibration of the field collected spot speed data. In addition to modifying the Wiedemann 99 car following model parameters, the look ahead distances and number of observed vehicles were also adjusted under the general car following parameters. **Table 8-2** and **Table 8-3** below summarize the adjusted or default “Freeway” car following and lane change driver behavior parameters used in Vissim to better replicate observed field conditions. The suggested ranges provided in Table 7-9 of the FDOT Traffic Analysis Handbook served as a starting point for calibration and any values that deviated from these ranges are noted in the tables. In general, only the CC4-CC9 car following parameters for the high-capacity driver behaviors deviated from the FDOT suggested ranges, which were to use the Vissim default values. Additional lane change parameters left at the software default values for all driver behaviors included waiting time before diffusion (60 seconds per FDOT guidelines), minimum headway (1.64 feet), and advanced merging.

Table 8-2 Vissim Freeway Car Following Parameters

Freeway Driver Behavior	Look Ahead Distance (max)	Observed Vehicles	CC0	CC1	CC2	CC3	CC4	CC5	CC6	CC7	CC8	CC9

<sup>1</sup>Values deviate from the FDOT suggested ranges in Table 7-9 of the Traffic Analysis Handbook.

A critical parameter in calibrating the freeway models was the connector lane change distance. This parameter controls where vehicles begin to react and change lanes in anticipation of downstream decisions. Starting with shorter distances and adjusting based on area specific driving behavior and lane utilization is critical in achieving the desired congestion levels in merge, diverge, and lane drop areas, especially in areas with multiple decision points. Connector lane change distance is a location specific function of driver behavior and can have a significant impact on traffic operations. Less aggressive drivers, for example, are more likely to respond earlier to guide signs regarding upcoming decision points. Adjusting the lane change distance is often needed to achieve the desired driver behavior, lane utilization, and level of congestion.

Another critical component in calibrating the freeway models was lane utilization at various ramp merges. While I-75 within the study area is not overly congested, the RITIS speed data indicated that slowdowns are present near multiple on-ramp merges due to significant lane utilization imbalances. **Figure 8-1** shows an example of the average weekday per lane volumes collected from RITIS on I-75 northbound at the Bonita Beach Road interchange during the February and March 2019 data collection period. The volumes in lane 1 (shown in blue) are significantly lower than the other two lanes as traffic moves over to accommodate the downstream merge. The resulting lane imbalance reduces the capacity of the freeway segment upstream of the merge and causes mainline speeds to drop.

A freeway driver behavior factor (Lane 1 Before Merge) was developed for this scenario using higher CCO (standstill distance), CC1 (headway time), and CC2 (following variation) car following parameters. A combination of per lane driver behaviors and blocked vehicle types on select links were used to encourage drivers to use the left-hand lanes. The use of blocked vehicles does not prohibit traffic from remaining in lane 1, but vehicles are more apt to avoid that lane if there are opportunities to change lanes.

Freeway driver behaviors from the calibrated existing conditions models will be carried forward to the future year models. Any changes to link behavior types due to geometric improvements will be documented in the future conditions reports.

## 8.4 Arterial and Ramp Calibration Parameters

The primary arterial and ramp calibration parameters included driver behavior parameters related to car following and lane changing. A total of five link/driver behavior types were developed to model the arterial and ramp segments. For all arterial and ramp driving behaviors, the Wiedemann 74 car following model was used. Low, mid, and high-capacity driver behavior parameters were developed in order to achieve calibration of the field collected travel time data. A critical parameter in calibrating the arterial models is the additive and multiplicative part of safety distance, which is adjusted to increase or decrease the saturation flow rate. The look ahead distances and number of observed vehicles were also adjusted under the general car following parameters.

**Table 8-4** below summarizes the adjusted or default “Urban” car following and lane change driver behavior parameters used in Vissim to better replicate observed field conditions. The suggested ranges provided in Table 7-9 of the FDOT Traffic Analysis Handbook served as a starting point for calibration and any values that deviated from these ranges are noted in the table below. For the arterial driving behaviors, only the waiting time before diffusion for the low-capacity driver behavior deviated from the FDOT suggested value of 60 seconds.

Figure 8-1 I-75 Northbound RITIS Volumes Per Lane at Bonita Beach Road Interchange

Table 8-4 Vissim Urban Driver Behavior Parameters

Urban Driving Behavior		Units	Vissim Default	Lower Capacity	Low to Mid Capacity	Mid Capacity	Mid to High Capacity	Higher Capacity

<sup>1</sup>Values deviate from the FDOT suggested ranges in Table 7-9 of the Traffic Analysis Handbook.

Arterial and ramp driver behaviors from the calibrated existing conditions models will be carried forward to the future year models. Any changes to link behavior types due to geometric improvements will be documented in the future conditions reports.

In addition to modifying global driver behavior parameters, localized adjustments to lane change distances and other network elements were required in order to achieve the desired levels of congestion and meet volume and travel time targets. Key adjustments included the following:

- Lane change distances were modified, as needed, based on animation observation to achieve a better replication of field-measured or field-observed lane utilization, travel times, and overall congestion levels.
- Desired speed distributions for roadway segments were initially coded based on the posted speed limit and adjusted +/- five mph in areas where travel times indicated slower or faster

desired speeds. Turning speeds were also adjusted, including per lane speeds for cars and trucks, to replicate the throughput volumes observed in the field.

- Priority rules were used to avoid blocking of intersections in areas that experienced queue spillback. These priority rules improved the driver behavior in these areas to more accurately reflect field observed gap acceptance and saturated driving conditions in the area.
- Crosswalks were modeled at select intersections along the following arterials where pedestrian crossing times required longer split times than available for the side-street phases. Pedestrian volumes at these locations were not significant enough to impact conflicting traffic, but when pedestrian phases are activated, the signal is thrown out of coordination and has a direct impact on vehicular travel time.
  - Colonial Boulevard (Ortiz Avenue/6 Mile Cypress Parkway)
  - Daniels Parkway (Fiddlesticks Boulevard, Danport Boulevard)
  - Corkscrew Road (Ben Hill Griffin Parkway)
  - Bonita Beach Road (Imperial Parkway, Downs Drive, Oakland Drive, Bonita Grande Drive)
  - Immokalee Road (Livingston Road, Strand Boulevard)
  - Pine Ridge Road (Livingston Road, Whippoorwill Lane, Napa Boulevard, Vineyards Boulevard, Logan Boulevard)
- Due to the limitations of the RBC controller in Vissim, the minimum green time for the protected eastbound/westbound left turns was increased at the following locations where pedestrians were modeled, to minimize excessive queuing during the transition phase. The minimum green time of 5 seconds was increased in both the AM and PM peak periods and did not reflect an overcompensation in left turn capacity that was observed in the field.
  - Daniels Parkway at Fiddlesticks Boulevard (minimum green time of 10 seconds was used in AM peak and 20 seconds was used in PM peak due to high volume of left turns in a single turn lane)
  - Daniels Parkway at Danport Boulevard (minimum green time of 10 seconds was used in both the AM and PM peak periods)
  - Immokalee Road at Livingston Road (minimum green time of 15 seconds was used in both the AM and PM peak periods)

The subarea Vissim models for each interchange area were calibrated using Bluetooth travel time data. The travel time data was collected over a 7-day period in February and March 2019 and was used to determine the average weekday (Tuesday-Thursday) travel times for the AM and PM peak hours. Any outlier data that appeared to be the result of incidents or other unknown factors was removed from the average travel time calculation. Since the placement of the Bluetooth sensors is critical to collecting accurate information, additional travel time data was collected using StreetLight Insight for three interchanges that had significantly longer travel times compared to the model output. Average weekday travel time data was collected from StreetLight over a two-month period (February and March 2019) for the Colonial Boulevard, Corkscrew Road, and Immokalee Road interchanges and was used to validate or replace the Bluetooth travel time data used for calibration.

## 9.0 Simulation Model Calibration Results

The existing conditions subarea Vissim models for each interchange area were calibrated to field measured travel times and balanced traffic volumes. Visual audits were also performed to check the consistency of the model with field conditions. While a peak period analysis was performed using one shoulder hour each before and after the peak hour, the calibration results discussed in the following subsections are for the peak hour only. The calibration parameters that were used were also assumed to be appropriate for shoulder hour conditions. The calibration results discussed below are based on the average of ten simulation runs and the simulated traffic volumes are based on total volume (sum of all turning movements) at the intersections. Individual movement results for each intersection are provided in **Appendix J**.

Overall, the calibration of the existing conditions subarea Vissim models for each interchange area produced simulation output that replicated existing traffic operations and field observed driver behavior for AM and PM peak periods. Calibration was met for 100 percent of volume and GEH targets, for both individual turning movements and overall intersections, and 98 percent of travel time segments.

### 9.1 SR 951 (Collier Boulevard)

A comparison of the AM and PM peak hour modeled traffic volumes and balanced field-collected volumes for each intersection are provided in **Table 9-1** and **Table 9-2**. As shown below, the AM and PM peak hour traffic volumes, as measured in the Vissim simulation models, correlate well with the balanced field-collected volumes, with a calculated GEH of 1.0 or less for all intersections. All individual turning movements meet both the volume criteria and GEH thresholds, with a calculated GEH of 0.9 or less in the AM peak hour and 0.8 or less in the PM peak hour for all movements. The sum of all modeled intersection volumes is within 1.1 and 0.1 percent of the sum of all intersection demand volumes in the AM and PM peak hours, respectively.

Table 9-1 SR 951 (Collier Boulevard) Traffic Volume Summary – AM Peak Hour

Collier Blvd & Business Cir S	4109	4139	0.5	30	0.7%	+/- 400 vph	Yes

A comparison of the AM and PM peak hour modeled travel times and field-collected travel times for Collier Boulevard are shown below in **Table 9-3**. With all field-measured travel times being less than seven minutes, the applicable calibration target used was simulated travel times within one minute of the field-measured travel times as opposed to the 15 percent threshold. As shown below, the average travel times, estimated using Vissim, correlate well with the travel times collected in the field for both the AM and PM peak hours.

Table 9-3 SR 951 (Collier Boulevard) Travel Time Summary

Travel Time Segments			Field Measured	Calibrated Model - Vissim			Meets Target?
Peak Hour	Direction	Segment		Travel Time (mins)	Travel Time (mins)	Difference	
			minutes			%	
AM	NB	South of Forest Glen Blvd to North of Golden Gate Pkwy	4.12	4.77	0.66	16.0%	Yes
	SB	North of Golden Gate Pkwy to South of Forest Glen Blvd	5.42	5.56	0.14	2.6%	Yes
PM	NB	South of Forest Glen Blvd to North of Golden Gate Pkwy	4.86	5.18	0.33	6.7%	Yes
	SB	North of Golden Gate Pkwy to South of Forest Glen Blvd	5.06	5.34	0.29	5.7%	Yes

## 9.2 Golden Gate Parkway

A comparison of the AM and PM peak hour modeled traffic volumes and balanced field-collected volumes for each intersection are provided in **Table 9-4** and **Table 9-5**. As shown below, the AM and PM peak hour traffic volumes, as measured in the Vissim simulation models, correlate well with the balanced field-collected volumes, with a calculated GEH of 1.2 or less for all intersections. All individual turning movements meet both the volume criteria and GEH thresholds, with a calculated GEH of 1.3 or less in the AM peak hour and 1.1 or less in the PM peak hour for all movements. The sum of all modeled intersection volumes is within 1.2 and 0.1 percent of the sum of all intersection demand volumes in the AM and PM peak hours, respectively.

	WB	E of 58th Street to W of Livingston Rd	3.62	3.79	0.17	4.8%	Yes

### 9.3 Pine Ridge Road

A comparison of the AM and PM peak hour modeled traffic volumes and balanced field-collected volumes for each intersection are provided in **Table 9-7** and **Table 9-8**. As shown below, the AM and PM peak hour traffic volumes, as measured in the Vissim simulation models, correlate well with the balanced field-collected volumes, with a calculated GEH of 2.1 or less for all intersections. All individual turning movements meet both the volume criteria and GEH thresholds, with a calculated GEH of 2.0 or less in both the AM and PM peak hours for all movements. The sum of all modeled intersection volumes is within 2.3 and 0.3 percent of the sum of all intersection demand volumes in the AM and PM peak hours, respectively.

	WB	East of Logan Blvd to West of Livingston Rd	5.30	5.89	0.60	11.2%	Yes

## 9.4 Vanderbilt Beach Road

A comparison of the AM and PM peak hour modeled traffic volumes and balanced field-collected volumes for each intersection are provided in **Table 9-10** and **Table 9-11**. As shown below, the AM and PM peak hour traffic volumes, as measured in the Vissim simulation models, correlate well with the balanced field-collected volumes, with a calculated GEH of 2.9 or less for all intersections. All individual turning movements meet both the volume criteria and GEH thresholds, with a calculated GEH of 2.7 or less in the AM peak hour and 0.7 or less in the PM peak hour for all movements. The sum of all modeled intersection volumes is within 2.7 and 0.6 percent of the sum of all intersection demand volumes in the AM and PM peak hours, respectively.

Table 9-10 Vanderbilt Beach Road Traffic Volume Summary – AM Peak Hour

Intersection	Measured Volume	Simulated Volume	GEH	Difference		Volume Measure	Meets Targets?

Vanderbilt Beach Rd & Logan Blvd	4853	4806	0.7	-47	-1.0%	+/- 400 vph	Yes

A comparison of the AM and PM peak hour modeled travel times and field-collected travel times for Vanderbilt Beach Road are shown below in **Table 9-12**. With all field-measured travel times being less than seven minutes, the applicable calibration target used was simulated travel times within one minute of the field-measured travel times as opposed to the 15 percent threshold. As shown below, the average travel times, estimated using Vissim, correlate well with the travel times collected in the field for both the AM and PM peak hours.

Table 9-12 Vanderbilt Beach Road Travel Time Summary

Travel Time Segments			Field Measured	Calibrated Model - Vissim			Meets Target?
Peak Hour	Direction	Segment	Travel Time (mins)	Travel Time (mins)	Difference		
					minutes	%	
AM	EB	West of Livingston Rd to East of Logan Blvd	5.40	5.28	-0.13	2.3%	Yes
	WB	East of Logan Blvd to West of Livingston Rd	5.27	4.97	-0.30	5.7%	Yes
PM	EB	West of Livingston Rd to East of Logan Blvd	4.40	5.27	0.87	19.8%	Yes
	WB	East of Logan Blvd to West of Livingston Rd	4.79	5.27	0.47	9.9%	Yes

## 9.5 Immokalee Road

A comparison of the AM and PM peak hour modeled traffic volumes and balanced field-collected volumes for each intersection are provided in **Table 9-13** and **Table 9-14**. As shown below, the AM and PM peak hour traffic volumes, as measured in the Vissim simulation models, correlate well with the balanced field-collected volumes, with a calculated GEH of 2.1 or less for all intersections. All individual turning movements meet both the volume criteria and GEH thresholds, with a calculated GEH of 2.2 or less in the AM peak hour and 1.0 or less in the PM peak hour for all movements. The sum of all modeled intersection volumes is within 2.3 and 0.8 percent of the sum of all intersection demand volumes in the AM and PM peak hours, respectively.

Table 9-13 Immokalee Road Traffic Volume Summary – AM Peak Hour

Intersection	Measured Volume	Simulated Volume	GEH	Difference		Volume Measure	Meets Targets?
				vph	%		
Immokalee Rd & Lakeland Ave	3750	3629	2.0	-121	-3.2%	+/- 400 vph	Yes
Immokalee Rd & Aston Dr	1279	1267	0.3	-12	-0.9%	+/- 15%	Yes

Livingston Rd & Carlton Lakes Blvd	2891	2873	0.3	-18	-0.6%	+/- 400 vph	Yes
Juliet Blvd & Useppa Way	929	929	0.0	0	0.0%	+/- 15%	Yes

A comparison of the AM and PM peak hour modeled travel times and field-collected travel times for Immokalee Road are shown below in **Table 9-15**. The calibration targets used were simulated travel times within one minute of the field-measured travel times for the three travel time segments that were less than seven minutes and within 15 percent for the eastbound travel time in the PM peak hour, which was approximately eight minutes. The Bluetooth travel time data indicated significant variability and possible incidents during data collection, particularly in the PM peak period. The eastbound travel time in the PM peak hour varied over 25 percent while the westbound travel time was nearly twice as long between one day and the next. StreetLight travel time data was compared to the Bluetooth data, but ultimately it was determined that the Bluetooth travel time data collected on the same day as the traffic counts provided the best fit for the PM peak hour. As shown below, the average travel times, estimated using Vissim, correlate well with the travel times collected in the field for both the AM and PM peak hours.

Table 9-15 Immokalee Road Travel Time Summary

Travel Time Segments			Field Measured	Calibrated Model - Vissim			Meets Target?
Peak Hour	Direction	Segment		Travel Time (mins)	Travel Time (mins)	Difference	
			minutes			%	
AM	EB	West of Livingston Rd to East of Logan Blvd	6.57	6.20	-0.37	5.7%	Yes

	WB	East of Logan Blvd to West of Livingston Rd	6.01	6.07	0.06	0.9%	Yes

## 9.6 Bonita Beach Road

A comparison of the AM and PM peak hour modeled traffic volumes and balanced field-collected volumes for each intersection are provided in **Table 9-16** and **Table 9-17**. As shown below, the AM and PM peak hour traffic volumes, as measured in the Vissim simulation models, correlate well with the balanced field-collected volumes, with a calculated GEH of 1.5 or less for all intersections. All individual turning movements meet both the volume criteria and GEH thresholds, with a calculated GEH of 2.0 or less in the AM peak hour and 1.4 or less in the PM peak hour for all movements. The sum of all modeled intersection volumes is within 1.5 and 0.2 percent of the sum of all intersection demand volumes in the AM and PM peak hours, respectively.

	WB	East of Bonita Grande Dr to West of Lime St	5.72	5.59	-0.13	2.3%	Yes

## 9.7 Corkscrew Road

A comparison of the AM and PM peak hour modeled traffic volumes and balanced field-collected volumes for each intersection are provided in **Table 9-19** and **Table 9-20**. As shown below, the AM and PM peak hour traffic volumes, as measured in the Vissim simulation models, correlate well with the balanced field-collected volumes, with a calculated GEH of 1.2 or less for all intersections. All individual turning movements meet both the volume criteria and GEH thresholds, with a calculated GEH of 2.4 or less in the AM peak hour and 1.2 or less in the PM peak hour for all movements. The sum of all modeled intersection volumes is within 1.1 and 0.6 percent of the sum of all intersection demand volumes in the AM and PM peak hours, respectively.

Corkscrew Rd & I-75 NB Ramps	4458	4422	0.5	-36	-0.8%	+/- 400 vph	Yes
Corkscrew Rd & Miromar Outlet Driveway	3410	3391	0.3	-19	-0.6%	+/- 400 vph	Yes
Ben Hill Griffin Pkwy & Miromar Outlet 1	2620	2615	0.1	-5	-0.2%	+/- 15%	Yes
Ben Hill Griffin Pkwy & Miromar Outlet 2	2148	2133	0.3	-15	-0.7%	+/- 15%	Yes
Corkscrew Rd & Ben Hill Griffin Pkwy	3751	3719	0.5	-32	-0.9%	+/- 400 vph	Yes
Stoneybrook Golf Blvd & Miromar Square Blvd	175	181	0.4	6	3.4%	+/- 100 vph	Yes

A comparison of the AM and PM peak hour modeled travel times and field-collected travel times for Corkscrew Road are shown below in **Table 9-21**. With all field-measured travel times being less than seven minutes, the applicable calibration target used was simulated travel times within one minute of the field-measured travel times as opposed to the 15 percent threshold. A combination of Bluetooth and StreetLight travel time data was used for calibration. Modeled travel times for two segments did not meet calibration targets using the field-collected Bluetooth data: the westbound direction in the AM peak hour and the eastbound direction in the PM peak hour. The Bluetooth travel times for the westbound segment ranged from approximately four minutes to over 13 minutes, with an average travel time of nearly six minutes. In the eastbound direction, the Bluetooth travel times ranged from approximately four minutes to 12 minutes, with an average travel time of nearly seven minutes. The large spread in travel time results seemed anomalous and warranted the use of a second data source to determine the veracity of the Bluetooth data.

Table 9-21 Corkscrew Road Travel Time Summary

Peak Hour	Direction	Travel Time Segments Segment	Field Measured Travel Time (mins)	Calibrated Model - Vissim			Meets Target?
				Travel Time (mins)	Difference		
					minutes	%	
AM	EB	West of Three Oaks Pkwy to East of Ben Hill Griffin Pkwy	4.76	4.43	-0.33	6.8%	Yes
	WB	East of Ben Hill Griffin Pkwy to West of Three Oaks Pkwy	4.57	4.76	0.19	4.2%	Yes
PM	EB	West of Three Oaks Pkwy to East of Ben Hill Griffin Pkwy	5.65	5.01	-0.64	11.3%	Yes
	WB	East of Ben Hill Griffin Pkwy to West of Three Oaks Pkwy	4.56	4.57	0.01	0.3%	Yes

StreetLight travel time data was compared to the Bluetooth data and was determined to be a better fit for calibration with an average travel time of approximately 4.5 minutes for the westbound segment in the AM peak hour and 5.5 minutes for the eastbound segment in the PM peak hour. As shown in **Table 9-21**, the average travel times, estimated using Vissim, correlate well with the travel times collected in the field for both the AM and PM peak hours.

## 9.8 Alico Road/Airport Access Road

A comparison of the AM and PM peak hour modeled traffic volumes and balanced field-collected volumes for each intersection are provided in **Table 9-22** and **Table 9-23**. As shown below, the AM and PM peak hour traffic volumes, as measured in the Vissim simulation models, correlate well with the balanced field-collected volumes, with a calculated GEH of 1.7 or less for all intersections. All individual turning movements meet both the volume criteria and GEH thresholds, with a calculated GEH of 2.0 or less in both the AM and PM peak hours for all movements. The sum of all modeled intersection volumes is within 1.9 and 0.3 percent of the sum of all intersection demand volumes in the AM and PM peak hours, respectively.

A comparison of the AM and PM peak hour modeled travel times and field-collected travel times for Alico Road are shown below in **Table 9-24**. With all field-measured travel times being less than seven minutes, the applicable calibration target used was simulated travel times within one minute of the field-measured travel times as opposed to the 15 percent threshold. As shown below, the average travel times, estimated using Vissim, correlate well with the travel times collected in the field for both the AM and PM peak hours.

Table 9-24 Alico Road Travel Time Summary

Travel Time Segments			Field Measured	Calibrated Model - Vissim			Meets Target?
Peak Hour	Direction	Segment		Travel Time (mins)	Travel Time (mins)	Difference	
			minutes			%	
AM	EB	West of Three Oaks Pkwy to East of Ben Hill Griffin Pkwy	2.96	3.43	0.47	15.8%	Yes
	WB	East of Ben Hill Griffin Pkwy to West of Three Oaks Pkwy	2.80	3.25	0.45	16.2%	Yes
PM	EB	West of Three Oaks Pkwy to East of Ben Hill Griffin Pkwy	4.34	3.83	-0.50	11.6%	Yes
	WB	East of Ben Hill Griffin Pkwy to West of Three Oaks Pkwy	2.84	3.37	0.53	18.6%	Yes

## 9.9 Daniels Parkway

A comparison of the AM and PM peak hour modeled traffic volumes and balanced field-collected volumes for each intersection are provided in **Table 9-25** and **Table 9-26**. As shown below, the AM and PM peak hour traffic volumes, as measured in the Vissim simulation models, correlate well with the balanced field-collected volumes, with a calculated GEH of 2.7 or less for all intersections. All individual turning movements meet both the volume criteria and GEH thresholds, with a calculated GEH of 2.3 or less in the AM peak hour and 1.0 or less in the PM peak hour for all movements. The sum of all

modeled intersection volumes is within 2.5 and 0.9 percent of the sum of all intersection demand volumes in the AM and PM peak hours, respectively.

Table 9-25 Daniels Parkway Traffic Volume Summary – AM Peak Hour

Intersection	Measured Volume	Simulated Volume	GEH	Difference		Volume Measure	Meets Targets?
				vph	%

A comparison of the AM and PM peak hour modeled travel times and field-collected travel times for Daniels Parkway are shown below in **Table 9-27**. With all field-measured travel times being less than seven minutes, the applicable calibration target used was simulated travel times within one minute of the field-measured travel times as opposed to the 15 percent threshold. As shown below, the average travel times, estimated using Vissim, correlate well with the travel times collected in the field for both the AM and PM peak hours.

Table 9-27 Daniels Parkway Travel Time Summary

Travel Time Segments			Field Measured	Calibrated Model - Vissim			Meets Target?
Peak Hour	Direction	Segment	Travel Time (mins)	Travel Time (mins)	Difference		
					minutes	%	
AM	EB	West of Apaloosa Ln to East of Treeline Ave	5.10	4.92	-0.18	3.4%	Yes

	WB	East of Treeline Ave to West of Apaloosa Ln	3.96	4.23	0.27	6.9%	Yes

## 9.10 SR 884 (Colonial Boulevard)

A comparison of the AM and PM peak hour modeled traffic volumes and balanced field-collected volumes for each intersection are provided in **Table 9-28** and **Table 9-29**. As shown below, the AM and PM peak hour traffic volumes, as measured in the Vissim simulation models, correlate well with the balanced field-collected volumes, with a calculated GEH of 1.3 or less for all intersections. All individual turning movements meet both the volume criteria and GEH thresholds, with a calculated GEH of 1.5 or less in the AM peak hour and 1.1 or less in the PM peak hour for all movements. The sum of all modeled intersection volumes is within 1.2 and 0.03 percent of the sum of all intersection demand volumes in the AM and PM peak hours, respectively.

Forum Blvd & Dynasty Dr	1832	1861	0.7	29	1.6%	+/- 15%	Yes

A comparison of the AM and PM peak hour modeled travel times and field-collected travel times for Colonial Boulevard are shown below in **Table 9-30**. The calibration targets used were simulated travel times within one minute of the field-measured travel times for the three travel time segments that were less than seven minutes and within 15 percent for the westbound travel time in the AM peak hour. As shown below, the AM and PM peak hour average travel times, estimated using Vissim, correlate well with the travel times collected in the field for all travel time segments except for the westbound direction in the AM peak. Bluetooth travel times for this segment ranged from approximately four minutes to nearly 16 minutes, with an average travel time of nine minutes. StreetLight travel time data was compared to the Bluetooth data and was determined to be a better fit for calibration with an average travel time of over seven minutes.

Table 9-30 SR 884 (Colonial Boulevard) Travel Time Summary

Travel Time Segments			Field Measured	Calibrated Model - Vissim			Meets Target?
Peak Hour	Direction	Segment	Travel Time (mins)	Travel Time (mins)	Difference		
					minutes	%	
AM	EB	West of Ortiz Ave to East of Dynasty Dr	4.02	3.71	-0.30	7.6%	Yes
	WB	East of Dynasty Dr to West of Ortiz Ave	7.33	5.26	-2.08	28.3%	No
PM	EB	West of Ortiz Ave to East of Dynasty Dr	4.65	4.18	-0.47	10.0%	Yes
	WB	East of Dynasty Dr to West of Ortiz Ave	5.05	4.79	-0.26	5.2%	Yes

During the calibration process it was determined that congestion on Colonial Boulevard is very sensitive to minor changes in calibration parameters. While it was possible to meet the travel time calibration target for this segment, the resulting congestion caused significant queue spillback on the southbound off-ramp that impacted the I-75 mainline calibration. Field observations showed ramp queues that briefly reached the mainline, but the backups did not last long, nor did they impact overall speeds on southbound I-75 as indicated by the RITIS data. Attempting to model a westbound travel

time that exceeded seven minutes also resulted in significant congestion on Forum Boulevard that failed to meet GEH targets. Calibration of Colonial Boulevard in the AM peak period focused on volume targets and visualization of overall congestion levels. Although the westbound travel time segment does not meet calibration targets during the AM peak hour, the driver behaviors and other calibration parameters used in the model provided travel times that closely matched the field-collected data for all other segments.

### 9.11 SR 82 (Dr. MLK Jr. Boulevard)

A comparison of the AM and PM peak hour modeled traffic volumes and balanced field-collected volumes for each intersection are provided in **Table 9-31** and **Table 9-32**. As shown below, the AM and PM peak hour traffic volumes, as measured in the Vissim simulation models, correlate well with the balanced field-collected volumes, with a calculated GEH of 0.9 or less for all intersections. All individual turning movements meet both the volume criteria and GEH thresholds, with a calculated GEH of 0.7 or less in the AM peak hour and 0.8 or less in the PM peak hour for all movements. The sum of all modeled intersection volumes is within 0.3 and 0.8 percent of the sum of all intersection demand volumes in the AM and PM peak hours, respectively.

**Table 9-31 SR 82 (MLK Boulevard) Traffic Volume Summary – AM Peak Hour**

Intersection	Measured Volume	Simulated Volume	GEH	Difference		Volume Measure	Meets Targets?

## 9.12 Luckett Road

A comparison of the AM and PM peak hour modeled traffic volumes and balanced field-collected volumes for each intersection are provided in **Table 9-34** and **Table 9-35**. As shown below, the AM and PM peak hour traffic volumes, as measured in the Vissim simulation models, correlate well with the balanced field-collected volumes, with a calculated GEH of 0.7 or less for all intersections. All individual turning movements meet both the volume criteria and GEH thresholds, with a calculated GEH of 0.9 or less in the AM peak hour and 0.6 or less in the PM peak hour for all movements. The sum of all modeled intersection volumes is within 1.5 and 0.3 percent of the sum of all intersection demand volumes in the AM and PM peak hours, respectively.

Table 9-34 Luckett Road Traffic Volume Summary – AM Peak Hour

Intersection	Measured Volume	Simulated Volume	GEH	Difference		Volume Measure	Meets Targets?
				vph	%		
Luckett Rd & Hamilton Dr	1625	1607	0.4	-18	-1.1%	+/- 15%	Yes
Luckett Rd & I-75 SB Ramps	1662	1639	0.6	-23	-1.4%	+/- 15%	Yes
Luckett Rd & I-75 NB Ramps	1235	1209	0.7	-26	-2.1%	+/- 15%	Yes
Luckett Rd & Northland Rd	865	856	0.3	-9	-1.0%	+/- 15%	Yes
Luckett Rd & Country Lakes Dr	309	298	0.6	-11	-3.6%	+/- 100 vph	Yes

Table 9-35 Luckett Road Traffic Volume Summary – PM Peak Hour

Intersection	Measured Volume	Simulated Volume	GEH	Difference		Volume Measure	Meets Targets?
				vph	%		
Luckett Rd & Hamilton Dr	1290	1285	0.1	-5	-0.4%	+/- 15%	Yes
Luckett Rd & I-75 SB Ramps	1195	1201	0.2	6	0.5%	+/- 15%	Yes
Luckett Rd & I-75 NB Ramps	1165	1165	0.0	0	0.0%	+/- 15%	Yes
Luckett Rd & Northland Rd	723	714	0.3	-9	-1.2%	+/- 15%	Yes
Luckett Rd & Country Lakes Dr	650	642	0.3	-8	-1.2%	+/- 100 vph	Yes

A comparison of the AM and PM peak hour modeled travel times and field-collected travel times for Luckett Road are shown below in **Table 9-36**. With all field-measured travel times being less than seven minutes, the applicable calibration target used was simulated travel times within one minute of the field-measured travel times as opposed to the 15 percent threshold. It should be noted that because Luckett Road is a relatively low volume and uncongested interchange, the daily sample size for the field-measured travel times was low (less than 15 vehicles) and the travel times were short (less than 90 seconds). As shown below, the average travel times, estimated using Vissim, correlate well with the travel times collected in the field for both the AM and PM peak hours.

Table 9-36 Luckett Road Travel Time Summary

Travel Time Segments			Field Measured	Calibrated Model - Vissim			Meets Target?
Peak Hour	Direction	Segment	Travel Time (mins)	Travel Time (mins)	Difference		
					minutes	%	
AM	EB	West of Enterprise Pkwy to East of Forum Blvd	1.03	1.53	0.50	48.4%	Yes
	WB	East of Forum Blvd to West of Enterprise Pkwy	1.36	1.64	0.28	20.7%	Yes
PM	EB	West of Enterprise Pkwy to East of Forum Blvd	0.98	1.64	0.65	66.6%	Yes
	WB	East of Forum Blvd to West of Enterprise Pkwy	1.08	1.56	0.48	44.3%	Yes

### 9.13 SR 80 (Palm Beach Boulevard)

A comparison of the AM and PM peak hour modeled traffic volumes and balanced field-collected volumes for each intersection are provided in **Table 9-37** and **Table 9-38**. As shown below, the AM and PM peak hour traffic volumes, as measured in the Vissim simulation models, correlate well with the balanced field-collected volumes, with a calculated GEH of 1.0 or less for all intersections. All individual turning movements meet both the volume criteria and GEH thresholds, with a calculated GEH of 1.4 or less in the AM peak hour and 0.9 or less in the PM peak hour for all movements. The sum of all modeled intersection volumes is within 0.2 and 1.1 percent of the sum of all intersection demand volumes in the AM and PM peak hours, respectively.

Table 9-37 SR 80 (Palm Beach Boulevard) Traffic Volume Summary – AM Peak Hour

Intersection	Measured Volume	Simulated Volume	GEH	Difference		Volume Measure	Meets Targets?

Palm Beach Blvd & I-75 NB Ramps	4915	4843	1.0	-72	-1.5%	+/- 400 vph	Yes
Palm Beach Blvd & Orange River Blvd	4704	4641	0.9	-63	-1.3%	+/- 400 vph	Yes
Palm Beach Blvd & 1st St	3751	3726	0.4	-25	-0.7%	+/- 400 vph	Yes

A comparison of the AM and PM peak hour modeled travel times and field-collected travel times for Palm Beach Boulevard are shown below in **Table 9-39**. With all field-measured travel times being less than seven minutes, the applicable calibration target used was simulated travel times within one minute of the field-measured travel times as opposed to the 15 percent threshold. As shown below, the average travel times, estimated using Vissim, correlate well with the travel times collected in the field for both the AM and PM peak hours.

Table 9-39 SR 80 (Palm Beach Boulevard) Travel Time Summary

Travel Time Segments			Field Measured	Calibrated Model - Vissim			Meets Target?
Peak Hour	Direction	Segment		Travel Time (mins)	Travel Time (mins)	Difference	
			minutes			%	
AM	EB	West of Morse Plaza to East of Orange River Blvd	1.29	2.04	0.75	58.0%	Yes
	WB	East of Orange River Blvd to West of Morse Plaza	1.78	1.75	-0.03	1.7%	Yes
PM	EB	West of Morse Plaza to East of Orange River Blvd	1.58	2.41	0.83	52.2%	Yes
	WB	East of Orange River Blvd to West of Morse Plaza	1.86	1.88	0.02	0.8%	Yes

## 9.14 Bayshore Road

A comparison of the AM and PM peak hour modeled traffic volumes and balanced field-collected volumes for each intersection are provided in **Table 9-40** and **Table 9-41**. As shown below, the AM and PM peak hour traffic volumes, as measured in the Vissim simulation models, correlate well with the balanced field-collected volumes, with a calculated GEH of 0.8 or less for all intersections. All individual turning movements meet both the volume criteria and GEH thresholds, with a calculated GEH of 2.8 or less in the AM peak hour and 0.9 or less in the PM peak hour for all movements. The sum of all modeled intersection volumes is within 1.2 and 0.9 percent of the sum of all intersection demand volumes in the AM and PM peak hours, respectively.

Table 9-40 Bayshore Road Traffic Volume Summary – AM Peak Hour

Intersection	Measured Volume	Simulated Volume	GEH	Difference		Volume Measure	Meets Targets?
				vph	%		
Bayshore Rd & 78 Dr	3169	3122	0.8	-47	-1.5%	+/- 400 vph	Yes
Bayshore Rd & I-75 SB Ramps	3529	3483	0.8	-46	-1.3%	+/- 400 vph	Yes
Bayshore Rd & I-75 NB Ramps	2407	2382	0.5	-25	-1.0%	+/- 15%	Yes
Bayshore Rd & Pritchett Pkwy	1663	1651	0.3	-12	-0.7%	+/- 15%	Yes
Bayshore Rd & Wells Rd	1528	1510	0.5	-18	-1.2%	+/- 15%	Yes

Table 9-41 Bayshore Road Traffic Volume Summary – PM Peak Hour

Intersection	Measured Volume	Simulated Volume	GEH	Difference		Volume Measure	Meets Targets?
				vph	%		
Bayshore Rd & 78 Dr	3214	3174	0.7	-40	-1.2%	+/- 400 vph	Yes
Bayshore Rd & I-75 SB Ramps	3408	3370	0.7	-38	-1.1%	+/- 400 vph	Yes
Bayshore Rd & I-75 NB Ramps	3085	3054	0.6	-31	-1.0%	+/- 400 vph	Yes
Bayshore Rd & Pritchett Pkwy	1850	1847	0.1	-3	-0.2%	+/- 15%	Yes
Bayshore Rd & Wells Rd	1706	1699	0.2	-7	-0.4%	+/- 15%	Yes

A comparison of the AM and PM peak hour modeled travel times and field-collected travel times for Bayshore Road are shown below in **Table 9-42**. With all field-measured travel times being less than seven minutes, the applicable calibration target used was simulated travel times within one minute of the field-measured travel times as opposed to the 15 percent threshold. As shown below, the average travel times, estimated using Vissim, correlate well with the travel times collected in the field for both the AM and PM peak hours.

Table 9-42 Bayshore Road Travel Time Summary

Travel Time Segments			Field Measured	Calibrated Model - Vissim			Meets Target?
Peak Hour	Direction	Segment	Travel Time (mins)	Travel Time (mins)	Difference		
					minutes	%

	WB	East of Wells Rd to West of Park 78 Dr	1.80	1.84	0.04	2.2%	Yes

## 10.0 I-75 Subarea Calibration Results

The existing conditions subarea Vissim models for the I-75 mainline were calibrated to field measured speed data and balanced traffic volumes. Visual audits were also performed to check the consistency of the model with field conditions. Due to the length of the I-75 corridor (42.2 miles) and the time it takes to traverse the entire network, the seeding period for the I-75 subarea and combined model in the AM peak period used the same volumes as the first shoulder hour. With such low volumes occurring during the 5:15 AM to 6:15 AM seeding period, traffic volumes recorded in the model during the AM peak hour were too low at the edges of the network. Higher traffic volumes during the seeding period were required in order to achieve the desired model throughput during the peak hour. The seeding period volumes during the PM peak period were closer to the first shoulder hour volumes and no adjustments were needed to achieve the calibration targets.

The calibration results discussed below are based on the average of ten simulation runs. Overall, the calibration of the existing conditions subarea Vissim models for the I-75 mainline produced simulation output that replicated existing traffic operations and field observed driver behavior for both the AM and PM peak period. Calibration was met for 100 percent of volume and GEH targets for all merge and diverge locations during both the peak hour and overall analysis period. In addition, more than 98 percent of the average hourly and 15-minute speeds are within the +/- 10 mph calibration target for both the AM and PM peak periods.

### 10.1 Volume Calibration Results

A comparison of the peak hour modeled traffic volumes and balanced field-collected volumes at each merge and diverge location are provided in **Table 10-1** and **Table 10-2** for the AM peak hour and **Table 10-3** and **Table 10-4** for the PM peak hour. While a peak period analysis was performed using one shoulder hour each before and after the peak hour, the calibration results shown below are for the peak hour only. The calibration parameters that were used were also assumed to be appropriate for shoulder hour conditions. Calibration results for the entire three-hour analysis period are provided in **Appendix J**.

As shown below, the AM and PM peak hour mainline and ramp volumes, as measured in the Vissim simulation models, correlate well with the balanced traffic demand volumes, with a calculated GEH of 2.9 or less in the AM peak hour and 1.2 or less in the PM peak hour for all merge and diverge locations. All locations meet both the volume criteria, and GEH thresholds and the sum of all volumes is within 2.6 and 0.8 percent of the sum of all demand volumes in the AM and PM peak hours, respectively.

It should be noted that the simulated volumes in the second shoulder hour are generally higher than the peak hour due to the length of the corridor and the time it takes to traverse the entire network. Traffic that did not reach its destination at the end of the peak hour gets recorded in the shoulder hour, resulting in GEH values of up to 3.9 in the AM peak period and 7.3 in the PM peak period. The combined traffic volumes for the entire three-hour analysis period have a calculated GEH of 2.8 or less and are within a maximum of 1.3 percent of all demand volumes.

I-75 SOUTH CORRIDOR MASTER PLAN

EXISTING CONDITIONS TRAFFIC TECHNICAL MEMORANDUM

## 10.2 Speed Calibration Results

Speed data for calibration on I-75 was obtained from RITIS. RITIS maintains all FDOT District One detector data in addition to several other FDOT Districts. The RITIS database was used to calculate average 15-minute, weekday speeds (Tuesday, Wednesday, and Thursday) between February and March 2019, which is consistent with the data collection period for the project. A total of 86 RITIS detectors (46 northbound and 40 southbound) within the project limits were used for calibration.

A comparison of the AM and PM peak period modeled speeds and RITIS detector speeds for I-75 are shown below in **Table 10-5** and **Table 10-6** for the AM peak period and **Table 10-7** and **Table 10-8** for the PM peak period. Average hourly speeds are provided for the three-hour analysis period. Average speeds in 15-minute intervals are provided in **Appendix J**. As shown below, the AM and PM average hourly speeds, estimated using Vissim, correlate well with the RITIS detector speed data. More than 98 percent of the average hourly speeds are within the +/- 10 mph calibration target for both the AM and PM peak periods. The average 15-minute speeds also meet calibration targets for over 98 percent of all periods.

Based on the RITIS speed data, the most significant congestion was observed on northbound I-75 between the Bonita Beach Road and Immokalee Road interchanges. The reduced speeds in this area are the result of lane utilization imbalances near the on-ramp merges, as previously discussed in the freeway calibration parameters. While the Vissim speeds correlated well with the RITIS speed data collected in February and March 2019, it should be noted that this congestion appears to be seasonal and is not present on a daily basis throughout the year. Based on the results of the speed calibration, the average speeds on I-75 in the subarea Vissim models are a good representation of the existing speeds that were obtained from the RITIS detectors.

## I-75 SOUTH CORRIDOR MASTER PLAN

EXISTING CONDITIONS TRAFFIC TECHNICAL MEMORANDUM

## 11.0 Combined Model Calibration Results

The calibrated subarea models were merged into a single model by combining the individual interchange models with the I-75 mainline model. The combined models were verified for calibration and then used for the analysis of existing conditions. The calibration results for the combined models are based on the average of ten simulation runs and a summary of the results is discussed below. Overall, the calibration of the existing conditions combined Vissim models produced simulation output that replicated existing traffic operations and field observed driver behavior for each interchange area and the I-75 mainline for the AM and PM peak periods. Calibration was met for 100 percent of peak hour volume and GEH targets for all intersections, as well as all merge and diverge locations during both the peak hour and overall analysis period. In addition, more than 96 percent of the average hourly and 15-minute speeds are within the +/- 10 mph calibration target for the AM and PM peak periods.

### 11.1 Interchange Volume Calibration Results

A comparison of the AM and PM peak hour modeled traffic volumes and balanced field-collected volumes for each intersection are provided in **Table 11-1** and **Table 11-2**. While a peak period analysis was performed using one shoulder hour each before and after the peak hour, the calibration results are for the peak hour only. The traffic volume results shown below are based on total volume (sum of all turning movements) at the intersections. Individual movement results for each intersection are provided in **Appendix K**. As shown below, the AM and PM peak hour traffic volumes, as measured in the combined Vissim simulation models, correlate well with the balanced field-collected volumes, with a calculated GEH of 3.4 or less in the AM peak hour and 1.1 or less in the PM peak hour for all intersections. The sum of all modeled intersection volumes is within 2.5 and 0.6 percent of the sum of all intersection demand volumes in the AM and PM peak hours, respectively.

## 11.2 Interchange Travel Time Calibration Results

A comparison of the AM and PM peak hour modeled travel times and field-collected travel times for all interchanges in the combined Vissim model are shown below in **Table 11-3** for the AM peak hour and **Table 11-4** for the PM peak hour. As shown below, the average travel times, estimated using Vissim, correlate well with the travel times collected in the field for both the AM and PM peak hours, except for the westbound travel time segment on Colonial Boulevard in the AM peak hour. This segment did not meet calibration targets in the subarea model as well, and the average travel time in the combined model is within 30 seconds of the subarea travel time. All other travel time segments meet the calibration targets in the combined model.

### 11.3 I-75 Mainline Volume Calibration Results

A comparison of the peak hour modeled traffic volumes and balanced field-collected volumes at each merge and diverge location are provided in **Table 11-5** and **Table 11-6** for the AM peak hour and **Table 11-7** and **Table 11-8** for the PM peak hour. While a peak period analysis was performed using one shoulder hour each before and after the peak hour, the calibration results shown below are for the peak hour only. Calibration results for the entire three-hour analysis period are provided in **Appendix K**.

As shown below, the AM and PM peak hour mainline and ramp volumes, as measured in the combined Vissim simulation models, correlate well with the balanced traffic demand volumes, with a calculated GEH of 4.1 or less in the AM peak hour and 1.5 or less in the PM peak hour for all merge and diverge locations. All locations meet both the volume criteria and GEH thresholds, and the sum of all volumes is within 4.2 and 2.5 percent of the sum of all demand volumes in the AM and PM peak hours, respectively. It should be noted that the simulated volumes in the second shoulder hour are generally higher than the peak hour due to the length of the corridor and the time it takes to traverse the entire network. Traffic that did not reach its destination at the end of the peak hour gets recorded in the shoulder hour, resulting in GEH values of up to 4.6 in the AM peak period and 9.1 in the PM peak period. The combined traffic volumes for the entire three-hour analysis period have a calculated GEH of 3.1 or less and are within a maximum of 1.7 percent of all demand volumes.

## 11.4 I-75 Mainline Speed Calibration Results

A comparison of the AM and PM peak period modeled speeds and RITIS detector speeds for I-75 are shown below in **Table 11-9** and **Table 11-10** for the AM peak period and **Table 11-11** and **Table 11-12** for the PM peak period. Average hourly speeds are provided for the three-hour analysis period. Average speeds in 15-minute intervals are provided in **Appendix K**. As shown below, the AM and PM average hourly speeds, estimated using Vissim, correlate well with the RITIS detector speed data. The average hourly speeds are within the +/- 10 mph calibration target for more than 96 percent of all periods during the AM peak, and over 98 percent of all periods in the PM peak. The average 15-minute speeds also meet calibration targets for 97 percent of all periods in both the AM and PM peak periods. Based on the results of the speed calibration, it is concluded that the average speeds on I-75 in the combined Vissim models are a good representation of the existing speeds that were obtained from the RITIS detectors.

I-75 SOUTH CORRIDOR MASTER PLAN

## 12.0 Existing Year Traffic Analysis Results

### 12.1 Intersection Analysis

An operational analysis of the existing conditions at each interchange area was performed using the calibrated combined Vissim model. While a peak period analysis was performed using one shoulder hour each before and after the peak hour, the overall intersection delay and LOS results discussed in the following subsections are for the peak hour only and are based on the average of ten simulation runs. Detailed operational results for each interchange area, including delay, LOS, and queuing for all movements, is provided in **Appendix L**.

In Vissim, the intersection LOS is computed from a microsimulation analysis and is therefore reported as an “estimated LOS.” Vissim quantifies overall intersection delays more realistically than typical equation-based HCM methods because it tracks individual vehicle movements and interactions. The estimated LOS for existing conditions is based on HCM criteria and thresholds for signalized and unsignalized intersections. The overall intersection delay and LOS for signalized intersections is based on the total control delay of all movements. The overall intersection delay and LOS for unsignalized intersections is based on the worst stop-controlled movement per HCM standards.

#### 12.1.1 SR 951 (Collier Boulevard)

A summary of overall intersection delay and LOS for the existing AM and PM peak hour conditions is provided in **Table 12-1** for Collier Boulevard. As shown below, all study area intersections are operating at LOS D or better except for the unsignalized intersection at Business Circle N, which is operating at LOS F in the PM peak hour. At the I-75 ramp terminal intersections, the low-volume movements to and from I-75 south of the interchange are operating at LOS E or F, but overall operations are LOS C or better.

Table 12-1 SR 951 (Collier Boulevard) Peak Hour Vissim Analysis Summary

Intersection	Traffic Control	AM Peak		PM Peak	
		Delay (sec/veh)	Estimated LOS	Delay (sec/veh)	Estimated LOS
Collier Blvd & Golden Gate Pkwy	Signalized	16.7	B	16.8	B
Collier Blvd & 25th Ave	Unsignalized	9.8	A	17.9	C
Collier Blvd & City Gate Blvd	Unsignalized	7.0	A	10.0	B
Collier Blvd & Magnolia Pond Dr	Signalized	18.3	B	14.1	B
Collier Blvd & I-75 NB Ramps	Signalized	26.2	C	18.1	B
Collier Blvd & I-75 SB Ramps	Signalized	18.5	B	20.3	C
Collier Blvd & Davis Blvd	Signalized	30.0	C	36.7	D
Collier Blvd & Business Cir N	Unsignalized	8.3	A	70.1	F
Collier Blvd & Business Cir S	Signalized	5.7	A	13.1	B

### 12.1.2 Golden Gate Parkway

A summary of overall intersection delay and LOS for the existing AM and PM peak hour conditions is provided in **Table 12-2** for Golden Gate Parkway. As shown below, all study area intersections are operating at LOS E or better. At the I-75 ramp terminal intersections, the southbound off-ramp movements are operating at LOS E in the PM peak hour, but overall operations are LOS C or better. The southbound off-ramp intersection also experiences significant queuing in the eastbound direction in the PM peak hour that extends beyond 66th Street. This queuing is the result of traffic stacking in the right lane to access both the southbound and northbound (loop) on-ramps.

Table 12-2 Golden Gate Parkway Peak Hour Vissim Analysis Summary

Intersection	Traffic Control	AM Peak		PM Peak	
		Delay (sec/veh)	Estimated LOS	Delay (sec/veh)	Estimated LOS
Golden Gate Pkwy & Livingston Rd	Signalized	51.2	D	51.9	D
Golden Gate Pkwy & 68th St	Unsignalized	16.1	C	43.8	E
Golden Gate Pkwy & 66th St	Unsignalized	28.3	D	40.9	E
Golden Gate Pkwy & I-75 SB Ramps	Signalized	26.7	C	34.5	C
Golden Gate Pkwy & I-75 NB Ramps	Signalized	6.4	A	8.3	A

Golden Gate Pkwy & 55th St	Unsignalized	12.5	B	11.0	B
Golden Gate Pkwy & 53rd St	Signalized	17.1	B	12.7	B
Santa Barbara Blvd & Painted Leaf Ln	Unsignalized	16.8	C	11.2	B

### 12.1.3 Pine Ridge Road

A summary of overall intersection delay and LOS for the existing AM and PM peak hour conditions is provided in **Table 12-3** for Pine Ridge Road. As shown below, all study area intersections are operating at LOS D or better except for the unsignalized intersection at Kraft Road, which is operating at LOS E in the PM peak hour. Multiple movements at the adjacent signalized intersections are operating at LOS E or F due to congestion and long cycle lengths, but the through movements on Pine Ridge Road are operating at LOS D or better. At the I-75 ramp terminal intersections, the off-ramp left-turn movements are operating at LOS E and the eastbound left turn at the northbound ramp terminal intersection is operating at LOS F in both the AM and PM peak hours, but overall operations are LOS C or better.

Table 12-3 Pine Ridge Road Peak Hour Vissim Analysis Summary

Intersection	Traffic Control	AM Peak		PM Peak	
		Delay (sec/veh)	Estimated LOS	Delay (sec/veh)	Estimated LOS
Pine Ridge Rd & Livingston Rd	Signalized	51.8	D	50.4	D
Pine Ridge Rd & Starbucks Driveway	Unsignalized	8.3	A	23.1	C
Pine Ridge Rd & Meridian Mall/Fire Station	Unsignalized	18.5	C	14.1	B

Livingston Rd & Uniforms Unlimited	Unsignalized	9.3	A	12.7	B

#### 12.1.4 Vanderbilt Beach Road

A summary of overall intersection delay and LOS for the existing AM and PM peak hour conditions is provided in **Table 12-4** for Vanderbilt Beach Road. As shown below, all study area intersections are operating at LOS D or better. Of note along this corridor is the westbound left-turn movement at Livingston Road that is operating at LOS E in the AM peak hour and has a maximum queue length of over 800 feet, which exceeds the available storage.

Table 12-4 Vanderbilt Beach Road Peak Hour Vissim Analysis Summary

Intersection	Traffic Control	AM Peak		PM Peak	
		Delay (sec/veh)	Estimated LOS	Delay (sec/veh)	Estimated LOS
Vanderbilt Beach Rd & Livingston Rd	Signalized	38.1	D	45.1	D
Vanderbilt Beach Rd & Bermuda Isle Cir	Unsignalized	7.7	A	12.8	B
Vanderbilt Beach Rd & Wilshire Lakes Blvd	Signalized	7.7	A	10.5	B
Vanderbilt Beach Rd & Oakes Blvd	Signalized	11.0	B	12.5	B
Vanderbilt Beach Rd & Vineyards Blvd	Signalized	11.3	B	14.4	B
Vanderbilt Beach Rd & Logan Blvd	Signalized	33.5	C	33.2	C

### 12.1.5 Immokalee Road

A summary of overall intersection delay and LOS for the existing AM and PM peak hour conditions is provided in **Table 12-5** for Immokalee Road. As shown below, all study area intersections are operating at LOS D or better except for the unsignalized intersection at Oakes Boulevard, which is operating at LOS E in the PM peak hour. Multiple movements at the adjacent signalized intersections are operating at LOS E or F due to congestion and long cycle lengths, but the through movements on Immokalee Road are operating at LOS D or better. At the I-75 ramp terminal intersections, the off-ramp left-turn movements are operating at LOS E or F, and the eastbound through movement at the southbound ramp terminal intersection is operating at LOS F in both the AM and PM peak hours, but overall operations are LOS C or better.

Table 12-5 Immokalee Road Peak Hour Vissim Analysis Summary

Intersection	Traffic Control	AM Peak		PM Peak	
		Delay (sec/veh)	Estimated LOS	Delay (sec/veh)	Estimated LOS
Immokalee Rd & Lakeland Ave	Signalized	14.8	B	13.2	B

### 12.1.6 Bonita Beach Road

A summary of overall intersection delay and LOS for the existing AM and PM peak hour conditions is provided in **Table 12-6** for Bonita Beach Road. As shown below, all study area intersections are operating at LOS D or better. Multiple movements at the adjacent signalized intersections are operating at LOS E or F due to congestion and long cycle lengths, but the through movements on Bonita Beach Road are operating at LOS D or better. At the I-75 ramp terminal intersections, the southbound off-ramp left and right-turn movements, as well as the northbound left-turn movement are operating at LOS E in both the AM and PM peak hours. The left turns onto the I-75 on-ramps are also operating at LOS E, but overall ramp terminal operations are LOS D or better.

Table 12-6 Bonita Beach Road Peak Hour Vissim Analysis Summary

Intersection	Traffic Control	AM Peak		PM Peak	
		Delay (sec/veh)	Estimated LOS	Delay (sec/veh)	Estimated LOS
Bonita Beach Rd & Lime St	Unsignalized	13.4	B	12.1	B
Bonita Beach Rd & Duck Lake Loop	Unsignalized	5.2	A	7.8	A

Bonita Grande Dr & Trade Way Dr	Unsignalized	7.2	A	7.4	A

### 12.1.7 Corkscrew Road

A summary of overall intersection delay and LOS for the existing AM and PM peak hour conditions is provided in **Table 12-7** for Corkscrew Road. As shown below, all study area intersections are operating at LOS D or better except for the unsignalized intersections at Puente Lane and Corkscrew Woodlands Boulevard, which are operating at LOS E or F. Multiple movements at the adjacent signalized intersection at Three Oaks Parkway are operating at LOS E, but the through movements on Corkscrew Road are operating at LOS D or better. At the I-75 ramp terminal intersections, the northbound off-ramp left-turn movements are operating at LOS E in both the AM and PM peak hours. The southbound off-ramp left-turn movement is operating at LOS E in the PM peak hour and the eastbound through movement also has a substantial queue of approximately 1,100 feet, but overall operations are LOS C or better.

Table 12-7 Corkscrew Road Peak Hour Vissim Analysis Summary

Intersection	Traffic Control	AM Peak		PM Peak	
		Delay (sec/veh)	Estimated LOS	Delay (sec/veh)	Estimated LOS
Corkscrew Rd & Three Oaks Pkwy	Signalized	40.2	D	46.2	D
Three Oaks Pkwy & Estero Town Commons Pl	Unsignalized	9.6	A	12.1	B
Corkscrew Rd & Puerto Way	Unsignalized	23.6	C	14.7	B

### 12.1.8 Alico Road/Airport Access Road

A summary of overall intersection delay and LOS for the existing AM and PM peak hour conditions is provided in **Table 12-8** for Alico Road and Airport Access Road. As shown below, all study area intersections are operating at LOS D or better. Multiple movements at the adjacent signalized intersections on Alico Road are operating at LOS E due to long cycle lengths, but the through movements are operating at LOS D or better. At the I-75 ramp terminal intersections, the off-ramp left-turn movements are operating at LOS E in the PM peak hour, but overall operations are LOS B or better. The adjacent Three Oaks Parkway intersection also experiences significant queuing in the eastbound direction in the AM and PM peak hours that extends up to 1,700 feet. This queuing is the result of traffic stacking in the right lane to access both the southbound and northbound (loop) on-ramps.

Table 12-8 Alico Road/Airport Access Road Peak Hour Vissim Analysis Summary

Intersection	Traffic Control	AM Peak		PM Peak	
		Delay (sec/veh)	Estimated LOS	Delay (sec/veh)	Estimated LOS
Alico Rd & Three Oaks Pkwy	Signalized	26.3	C	33.4	C

Ben Hill Griffin Pkwy & Terminal Access Rd	Signalized	13.6	B	21.2	C

### 12.1.9 Daniels Parkway

A summary of overall intersection delay and LOS for the existing AM and PM peak hour conditions is provided in **Table 12-9** for Daniels Parkway. As shown below, all study area intersections are operating at LOS D or better except for multiple unsignalized intersections that are operating at LOS E or F in both the AM and PM peak hours. Multiple movements at the adjacent signalized intersections are operating at LOS E or F due to congestion and long cycle lengths, but the through movements are operating at LOS D or better. At the I-75 ramp terminal intersections, the southbound off-ramp left-turn movement is operating at LOS F in both the AM and PM peak hours, and the northbound left-turn movement is operating at LOS E and F in the AM and PM peak hours, respectively. The westbound left-turn movement at the southbound off-ramp intersection is also operating at LOS F in the PM peak hour. The southbound off-ramp intersection experiences significant queuing in the eastbound direction in both peak hours that extends beyond Danport Boulevard. This queuing is the result of traffic stacking in the right lane to access both the southbound and northbound (loop) on-ramps.

Table 12-9 Daniels Parkway Peak Hour Vissim Analysis Summary

Intersection	Traffic Control	AM Peak		PM Peak	
		Delay (sec/veh)	Estimated LOS	Delay (sec/veh)	Estimated LOS
Daniels Pkwy & Powers Ct	Unsignalized	51.4	F	39.6	E
Daniels Pkwy & Weirisma Ln	Unsignalized	13.0	B	12.3	B

Fiddlesticks Blvd & Cody Lee Rd	Unsignalized	9.3	A	20.5	C
Treeline Ave & Intercom Ln	Signalized	9.4	A	18.6	B

### 12.1.10 SR 884 (Colonial Boulevard)

A summary of overall intersection delay and LOS for the existing AM and PM peak hour conditions is provided in **Table 12-10** for Colonial Boulevard. As shown below, all study area intersections are operating at LOS D or better except for the Ortiz Avenue intersection that is operating at LOS E in the PM peak hour. Multiple movements at the adjacent signalized intersections are operating at LOS E or F due to congestion and long cycle lengths, but the through movements on Colonial Boulevard are operating at LOS D or better. The Ortiz Avenue intersection has five and seven movements that are operating at LOS F in the AM and PM peak hours, respectively. This intersection has cycle lengths that are up to 220 seconds long, so many movements experience long delays just waiting for the phase to turn green.

Table 12-10 SR 884 (Colonial Boulevard) Peak Hour Vissim Analysis Summary

Intersection	Traffic Control	AM Peak		PM Peak	
		Delay (sec/veh)	Estimated LOS	Delay (sec/veh)	Estimated LOS
Colonial Blvd & Ortiz Ave	Signalized	45.0	D	56.1	E
Colonial Blvd & Golden Corral Dr	Unsignalized	13.2	B	12.3	B
Ortiz Ave & Colonial Center Dr	Unsignalized	10.5	B	17.2	C
6 Mile Cypress Pkwy & Rolfes Rd	Unsignalized	7.6	A	13.8	B
6 Mile Cypress Pkwy & McDonalds Drwy	Signalized	10.1	B	35.9	D
Colonial Blvd & I-75 SB Ramps	Signalized	28.5	C	26.2	C
Colonial Blvd & I-75 NB Ramps	Signalized	20.4	C	25.1	C
Colonial Blvd & Forum Blvd	Signalized	22.0	C	26.4	C
Forum Blvd & Home Depot Driveway	Unsignalized	7.1	A	10.0	A
Forum Blvd & Dynasty Dr	Signalized	18.1	B	24.6	C

At the I-75 ramp terminal intersections, the southbound off-ramp left-turn movement is operating at LOS F in both the AM and PM peak hours, and the northbound left-turn movement is operating at LOS E and F in the AM and PM peak hours, respectively. The southbound off-ramp intersection also experiences significant queuing in the westbound direction in the AM peak hour that extends beyond the northbound ramp terminal. This queuing is the result of congestion in the westbound direction between Ortiz Avenue and the southbound off-ramp. There is also significant queuing in the eastbound direction at Ortiz Avenue as a result of traffic stacking in the right lane to access both the southbound and northbound (loop) on-ramps.

#### 12.1.11 SR 82 (MLK Boulevard)

A summary of overall intersection delay and LOS for the existing AM and PM peak hour conditions is provided in **Table 12-11** for MLK Boulevard. As shown below, all study area intersections are operating at LOS D or better. Multiple movements at the adjacent signalized intersections are operating at LOS E due to long cycle lengths, but the through movements are operating at LOS C or better. At the I-75 ramp terminal intersections, the southbound off-ramp left-turn movement is operating at LOS E in the PM peak hour and the northbound off-ramp left-turn movement is operating at LOS E or F in both the AM and PM peak hours. The westbound and eastbound left-turn movements to the I-75 on-ramps are also operating at LOS E or F in the AM peak hour, but the queuing does not impact the through movements on MLK Boulevard.

Table 12-11 SR 82 (MLK Boulevard) Peak Hour Vissim Analysis Summary

Intersection	Traffic Control	AM Peak		PM Peak	
		Delay (sec/veh)	Estimated LOS	Delay (sec/veh)	Estimated LOS
MLK Jr Blvd & Ortiz Ave	Signalized	34.7	C	34.2	C
MLK Jr Blvd & Park 82 Dr	Unsignalized	31.3	D	29.5	D
MLK Jr Blvd & I-75 SB Ramps	Signalized	22.6	C	16.4	B
MLK Jr Blvd & I-75 NB Ramps	Signalized	20.2	C	20.6	C
MLK Jr Blvd & Destination Dr	Unsignalized	27.9	D	30.2	D
MLK Jr Blvd & Forum Blvd	Signalized	22.1	C	13.7	B

### 12.1.12 Lockett Road

A summary of overall intersection delay and LOS for the existing AM and PM peak hour conditions is provided in **Table 12-12** for Lockett Road. As shown below, all study area intersections are operating at LOS D or better except for the I-75 northbound off-ramp. Both ramp terminals are unsignalized and the intersection LOS is based on the worst stop-controlled movement, which is the off-ramp left-turn movement.

Table 12-12 Lockett Road Peak Hour Vissim Analysis Summary

Intersection	Traffic Control	AM Peak		PM Peak	
		Delay (sec/veh)	Estimated LOS	Delay (sec/veh)	Estimated LOS
Lockett Rd & Hamilton Dr	Signalized	14.4	B	14.4	B
Lockett Rd & I-75 SB Ramps	Unsignalized	31.4	D	16.2	C
Lockett Rd & I-75 NB Ramps	Unsignalized	64.8	F	26.0	D
Lockett Rd & Northland Rd	Unsignalized	7.4	A	7.5	A
Lockett Rd & Country Lakes Dr	Unsignalized	22.5	A	10.3	B

### 12.1.13 SR 80 (Palm Beach Boulevard)

A summary of overall intersection delay and LOS for the existing AM and PM peak hour conditions is provided in **Table 12-13** for Palm Beach Boulevard. As shown below, all study area intersections are operating at LOS C or better except for the unsignalized intersection at Morse Plaza, which is operating at LOS E in the AM peak hour and LOS F in the PM peak hour. At the I-75 southbound ramp terminal intersection, the southbound left-turn movement is operating at LOS E in both the AM and PM peak hours. At the I-75 northbound ramp terminal intersection, the eastbound left-turn movement is operating at LOS F in the PM peak hour but has a queue length of only 175 feet.

Table 12-13 SR 80 (Palm Beach Boulevard) Peak Hour Vissim Analysis Summary

Intersection	Traffic Control	AM Peak		PM Peak	
		Delay (sec/veh)	Estimated LOS	Delay (sec/veh)	Estimated LOS
Palm Beach Blvd & Morse Plaza	Unsignalized	42.6	E	154.7	F
Palm Beach Blvd & I-75 SB Ramps	Signalized	14.9	B	22.8	C
Palm Beach Blvd & I-75 NB Ramps	Signalized	16.1	B	24.6	C
Palm Beach Blvd & Orange River Blvd	Signalized	18.7	B	19.7	B
Palm Beach Blvd & 1st St	Unsignalized	10.3	B	18.8	C

### 12.1.14 Bayshore Road

A summary of overall intersection delay and LOS for the existing AM and PM peak hour conditions is provided in **Table 12-14** for Bayshore Road. As shown below, all study area intersections are operating at LOS C or better except for the unsignalized intersection at Park78 Drive, which is operating at LOS F in the AM peak hour. At the I-75 ramp terminal intersections, the off-ramp left-turn movements are operating at LOS E in the PM peak hour. The eastbound left-turn and U-turn movement at the I-75 northbound ramp terminal intersection is operating at LOS E and F in the AM and PM peak hours, respectively. The queue lengths for both the westbound and eastbound left-turn movements at the interchange exceed the available storage and could impact operations of through traffic on Bayshore Road.

Table 12-14 Bayshore Road Peak Hour Vissim Analysis Summary

Intersection	Traffic Control	AM Peak		PM Peak	
		Delay (sec/veh)	Estimated LOS	Delay (sec/veh)	Estimated LOS
Bayshore Rd & 78 Dr	Unsignalized	52.2	F	21.0	C
Bayshore Rd & I-75 SB Ramps	Signalized	12.4	B	6.5	A
Bayshore Rd & I-75 NB Ramps	Signalized	20.7	C	25.5	C
Bayshore Rd & Pritchett Pkwy	Unsignalized	10.4	B	8.9	A
Bayshore Rd & Wells Rd	Unsignalized	16.4	C	15.7	C

## 12.2 Intersection Analysis Summary

Overall, the existing conditions analysis indicates that the I-75 ramp terminal intersections and adjacent signalized intersections are operating at LOS D or better in the AM and PM peak hours except for the following locations:

- Colonial Boulevard and 6 Mile Cypress Parkway/Ortiz Avenue: LOS E in PM peak hour.
- Lockett Road and I-75 Northbound Ramp Terminal: LOS F in AM peak hour (unsignalized).

Multiple unsignalized intersections or driveways are operating at LOS E or F, but the side street/driveway delays do not impact interchange operations. Individual movements at the interchange ramp terminal intersections that are operating at LOS E or F in the AM or PM peak hours are summarized below:

- Collier Boulevard: I-75 northbound and southbound off-ramp left-turn movements are operating at LOS E in the AM and PM peak hours. The low volume southbound left-turn movement to southbound I-75 is operating at LOS E and F in the AM and PM peak hours, respectively.
- Golden Gate Parkway: I-75 southbound off-ramp left- and right-turn movements are operating at LOS E in the PM peak hour.
- Pine Ridge Road: I-75 northbound and southbound off-ramp left-turn movements are operating at LOS E and the eastbound left turn at the northbound ramp terminal intersection is operating at LOS F in both the AM and PM peak hours.
- Immokalee Road: I-75 northbound and southbound off-ramp left-turn movements are operating at LOS E or F, and the eastbound through movement at the southbound ramp terminal intersection is operating at LOS F in both the AM and PM peak hours.
- Bonita Beach Road: I-75 southbound off-ramp left and right-turn movements, as well as the northbound off-ramp left-turn movement are operating at LOS E in both the AM and PM peak hours. The eastbound and westbound left turns onto the I-75 on-ramps are also operating at LOS E.
- Corkscrew Road: I-75 northbound off-ramp left-turn movement is operating at LOS E in both the AM and PM peak hours. The southbound off-ramp left-turn movement is operating at LOS E in the PM peak hour.
- Alico Road: I-75 northbound and southbound off-ramp left-turn movements are operating at LOS E in the PM peak hour.

- Daniels Parkway: I-75 southbound off-ramp left-turn movement is operating at LOS F in both the AM and PM peak hours, and the northbound off-ramp left-turn movement is operating at LOS E and F in the AM and PM peak hours, respectively. The westbound left-turn movement at the southbound on-ramp intersection is also operating at LOS F in the PM peak hour.
- Colonial Boulevard: I-75 southbound off-ramp left-turn movement is operating at LOS F in both the AM and PM peak hours, and the northbound off-ramp left-turn movement is operating at LOS E and F in the AM and PM peak hours, respectively.
- MLK Boulevard: I-75 southbound off-ramp left-turn movement is operating at LOS E in the PM peak hour and the northbound off-ramp left-turn movement is operating at LOS E or F in both the AM and PM peak hours. The westbound and eastbound left-turn movements to the I-75 on-ramps are also operating at LOS E or F in the AM peak hour.
- Lockett Road: I-75 northbound off-ramp left-turn movement is operating at LOS F in the AM peak hour.
- Palm Beach Boulevard: I-75 southbound off-ramp left-turn movement is operating at LOS E in both the AM and PM peak hours. The eastbound left-turn movement at the I-75 northbound on-ramp is operating at LOS F in the PM peak hour.
- Bayshore Road: I-75 northbound and southbound off-ramp left-turn movements are operating at LOS E in the PM peak hour. The eastbound left-turn and U-turn movement at the I-75 northbound ramp terminal intersection is operating at LOS E and F in the AM and PM peak hours, respectively.

Queuing at the interchange ramp terminals that spills back to adjacent intersections, or queuing at adjacent intersections that impacts the I-75 interchanges are summarized below:

- Golden Gate Parkway: The southbound off-ramp intersection experiences queuing of over 1,600 feet in the eastbound direction in the PM peak hour that extends beyond 66th Street. This queuing is the result of traffic stacking in the right lane to access both the southbound and northbound (loop) on-ramps.
- Corkscrew Road: The eastbound through movement at the southbound ramp terminal has a substantial queue of approximately 1,100 feet in the PM peak hour, which impacts the adjacent unsignalized intersection of Corkscrew Woodlands Boulevard.
- Alico Road: The adjacent Three Oaks Parkway intersection experiences queuing in the eastbound direction in the AM and PM peak hours that extends up to 1,700 feet. This queuing is the result of traffic stacking in the right lane to access both the southbound and northbound (loop) on-ramps.
- Daniels Parkway: The southbound off-ramp intersection experiences queuing in the eastbound direction in both peak hours that extends beyond Danport Boulevard. This queuing is the result of traffic stacking in the right lane to access both the southbound and northbound (loop) on-ramps. Westbound queuing at Danport Boulevard also approaches the southbound ramp terminal in the AM peak hour.
- Colonial Boulevard: The westbound through movement at the southbound ramp terminal experiences a queue of approximately 1,300 feet in the AM peak hour, which spills back beyond the northbound ramp terminal.

## 12.3 Ramp Queue Analysis

A summary of the AM and PM peak hour queue lengths for the I-75 interchange off-ramps is provided in **Table 12-15**. The storage lengths for the off-ramps were measured from the stop bar to the end of the turn lanes, including taper, and were compared to the maximum queue lengths recorded in Vissim. The ramp length from the stop bar to the I-75 gore point has also been provided for reference. As shown below, the existing queue lengths do not exceed the available off-ramp storage except for the northbound off-ramp at Lockett Road in the AM peak hour. It should be noted that off-ramp queues were observed briefly extending to the I-75 mainline during the data collection and calibration period at Colonial Boulevard and Bayshore Road. The seasonally adjusted volumes used for analysis are lower than the volumes used for calibration, indicating that these queues are not consistent throughout the year, and are sensitive to seasonal fluctuations in traffic volumes.

Table 12-15 I-75 Vissim Ramp Queue Analysis Summary

Interchange	Ramp	Storage (ft)	Ramp Length (ft)	AM Peak	PM Peak	Exceeds Storage?	Exceeds Ramp?
				Max Queue (ft)	Max Queue (ft)		
Bayshore Drive	I-75 NB Off-Ramp	1180	1680	335	470	No	No
	I-75 SB Off-Ramp	670	1310	61	122	No	No

## 12.4 Arterial Analysis

A summary of the AM and PM peak hour average speeds on the interchange arterials is provided in **Table 12-16** and **Table 12-17**. The average speed was calculated based on the same travel time segments used for calibration. Average speeds ranged from 19 to 36 mph in the AM peak and 20 to 34 mph in the PM peak and will be used for comparison with future conditions.

Table 12-16 Interchange Arterial Vissim Analysis Summary – AM Peak Hour

Interchange	Dir	Segment	Travel Time (min)	Length (miles)	Average Speed (mph)
Bayshore Dr	EB	West of Park 78 Dr to East of Wells Rd	1.65	1.0	36

## 12.5 I-75 Mainline Analysis

An operational analysis of the existing conditions on the I-75 mainline was performed using the calibrated combined Vissim model. While a peak period analysis was performed using one shoulder hour each before and after the peak hour, the travel time and LOS results discussed in the following subsections are for the peak hour only. The analysis results discussed below are based on the average of ten simulation runs. In Vissim, the mainline LOS is computed from a microsimulation analysis and is therefore reported as an “estimated LOS.” Vissim quantifies speed and density more realistically than typical equation-based HCM methods because it tracks individual vehicle movements and interactions. The estimated LOS for existing conditions is based on HCM criteria and thresholds for basic freeway, merge, diverge, and weaving segments.

### 12.5.1 I-75 Mainline Travel Times

A summary of the AM and PM peak hour travel times on northbound and southbound I-75 is provided in **Table 12-18** and **Table 12-19**. The results will be used for comparison with future conditions and include travel times along the entire corridor as well as shorter segments covering multiple interchanges. The average speed from south of Collier Boulevard to north of Bayshore Road was 71 mph in both directions of I-75 during the AM peak hour. During the PM peak hour, the average speed along the corridor was 68 mph in the northbound direction and 73 mph in the southbound direction.

Table 12-18 I-75 Mainline Travel Time – AM Peak Hour

Segment	Travel Time (min)	Length (miles)	Average Speed (mph)
I-75 Northbound - South of Collier Blvd to North of Bayshore Rd	36.9	43.5	71
I-75 Northbound - South of Collier Blvd to Pine Ridge Rd	5.6	6.9	74
I-75 Northbound - Pine Ridge Rd to Bonita Beach Rd	7.5	8.4	67
I-75 Northbound - Bonita Beach Rd to Corkscrew Rd	6.4	7.4	68
I-75 Northbound - Corkscrew Rd to Daniels Pkwy	6.8	8.0	71
I-75 Northbound - Daniels Pkwy to MLK Blvd	5.2	6.2	72
I-75 Northbound - MLK Blvd to North of Bayshore Rd	5.5	6.7	73
I-75 Southbound - North of Bayshore Rd to South of Collier Blvd	36.8	43.6	71
I-75 Southbound - North of Bayshore Rd to MLK Blvd	5.7	6.8	71
I-75 Southbound - MLK Blvd to Daniels Pkwy	5.2	6.2	71
I-75 Southbound - Daniels Pkwy to Corkscrew Rd	6.8	8.1	71
I-75 Southbound - Corkscrew Rd to Bonita Beach Rd	6.5	7.3	68
I-75 Southbound - Bonita Beach Rd to Pine Ridge Rd	7.2	8.4	69
I-75 Southbound - Pine Ridge Rd to South of Collier Blvd	5.5	6.9	76

Table 12-19 I-75 Mainline Travel Time – PM Peak Hour

Segment	Travel Time (min)	Length (miles)	Average Speed (mph)
I-75 Northbound - South of Collier Blvd to North of Bayshore Rd	38.6	43.5	68
I-75 Northbound - South of Collier Blvd to Pine Ridge Rd	5.6	6.9	73
I-75 Northbound - Pine Ridge Rd to Bonita Beach Rd	7.9	8.4	64
I-75 Northbound - Bonita Beach Rd to Corkscrew Rd	6.9	7.4	64
I-75 Northbound - Corkscrew Rd to Daniels Pkwy	7.0	8.0	69
I-75 Northbound - Daniels Pkwy to MLK Blvd	5.5	6.2	67
I-75 Northbound - MLK Blvd to North of Bayshore Rd	5.6	6.7	72
I-75 Southbound - North of Bayshore Rd to South of Collier Blvd	36.1	43.6	73
I-75 Southbound - North of Bayshore Rd to MLK Blvd	5.6	6.8	72
I-75 Southbound - MLK Blvd to Daniels Pkwy	5.0	6.2	73
I-75 Southbound - Daniels Pkwy to Corkscrew Rd	6.6	8.1	73
I-75 Southbound - Corkscrew Rd to Bonita Beach Rd	6.3	7.3	70
I-75 Southbound - Bonita Beach Rd to Pine Ridge Rd	7.1	8.4	71
I-75 Southbound - Pine Ridge Rd to South of Collier Blvd	5.5	6.9	76

### 12.5.2 I-75 Mainline Speeds

A summary of the average speeds along northbound and southbound I-75 is provided in **Figure 12-1** and **Figure 12-2** for the AM peak period and **Figure 12-3** and **Figure 12-4** for the PM peak period. As shown below, the average speeds along I-75 from south of Collier Boulevard to north of Bayshore Road are at or near free flow (greater than 65 mph) for most of the corridor, with some areas experiencing minor slowdowns between 55 and 65 mph, particularly at or near interchanges. I-75 northbound experiences minor congestion (speeds between 45 and 55 mph) around the Bonita Beach Road and Immokalee Road interchanges during both the AM and PM peak periods. No other congested areas or bottlenecks were observed on I-75 in the existing conditions Vissim models.

Figure 12-1 I-75 Northbound Speeds – AM Peak Period

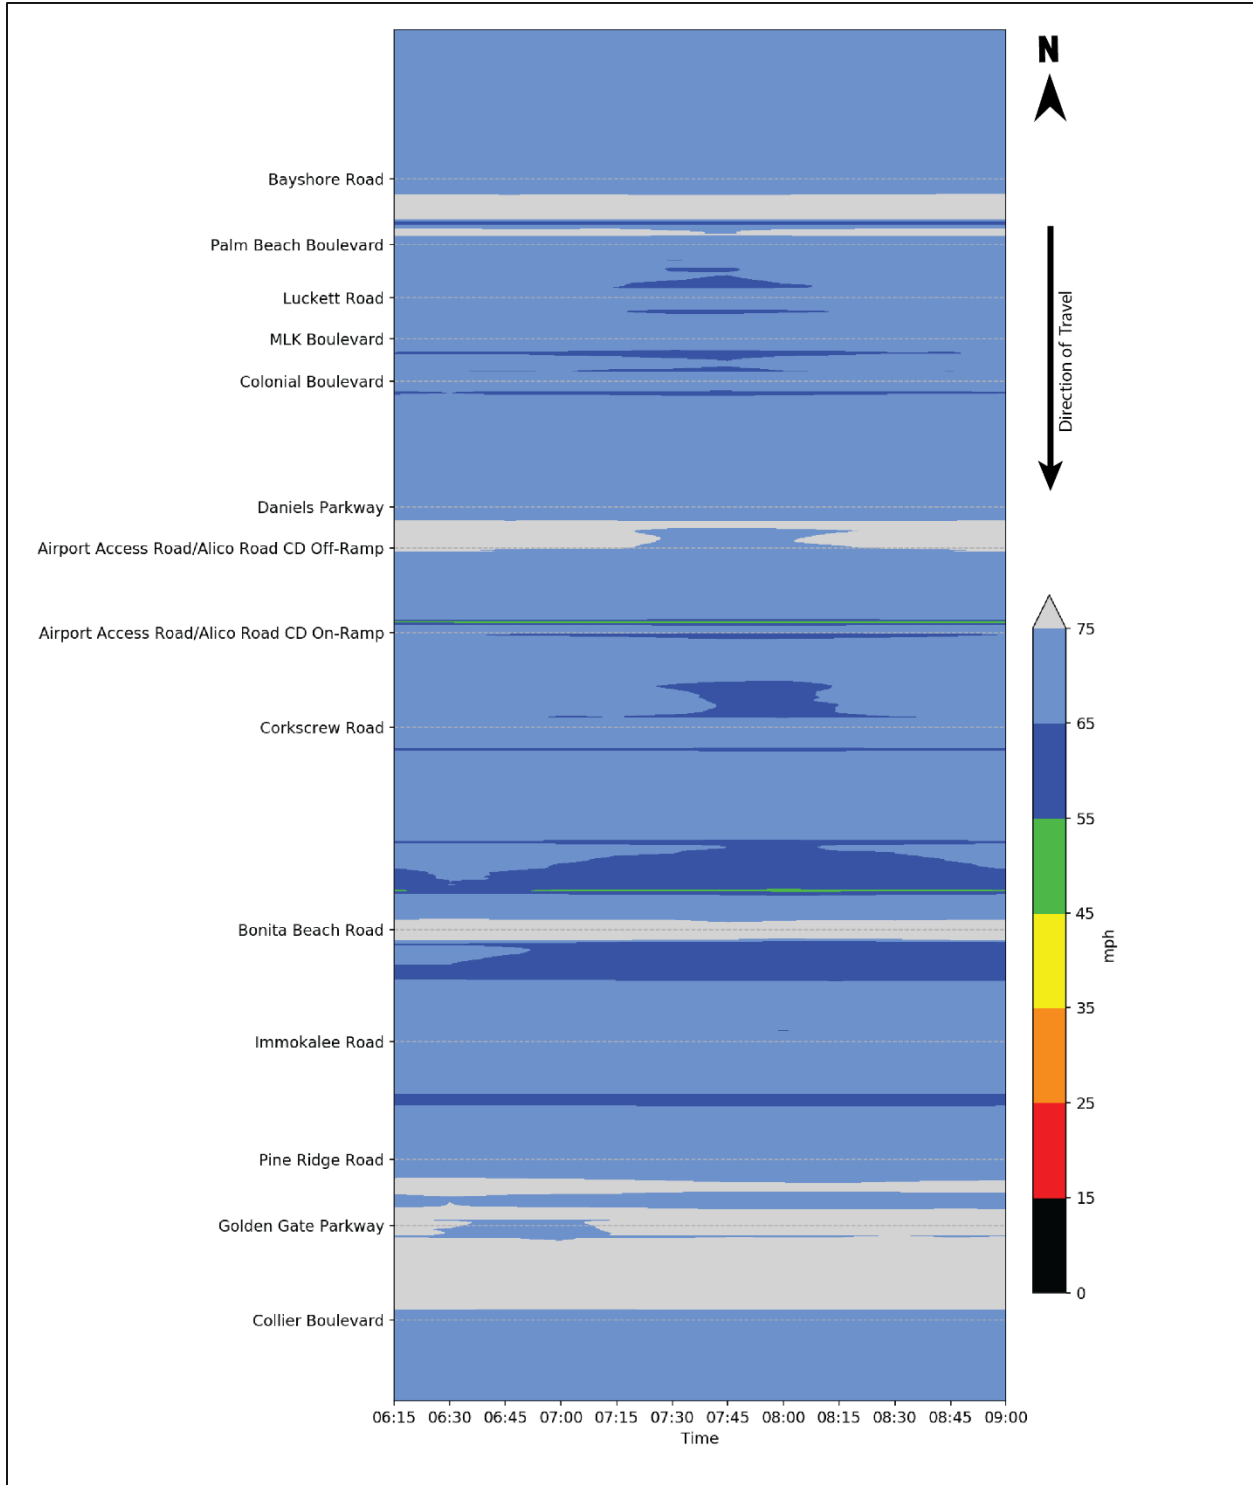

Figure 12-2 I-75 Southbound Speeds – AM Peak Period

Figure 12-3 I-75 Northbound Speeds – PM Peak Period

Figure 12-4 I-75 Southbound Speeds – PM Peak Period

### 12.5.3 I-75 Mainline Operations

A summary of mainline operations (density, speed, LOS, and volume served) is provided in **Figure 12-5** through **Figure 12-8** for the existing AM peak hour and **Figure 12-9** through **Figure 12-12** for the existing PM peak hour. The Vissim analysis results for each link segment are based on the weighted average per lane and an approximate 1,500-foot influence area for merge and diverge segments as defined in the HCM. As shown below, the I-75 mainline is operating at speeds between 59 and 78 mph in the AM peak hour and between 56 and 79 mph in the PM peak hour. More than 97 percent of the traffic demand is being served in both peak hours and the corridor is operating at an estimated LOS of C or better in both the AM and PM peak hours. Higher densities and corresponding lower speeds are predominately in the southbound direction during the AM peak hour and in the northbound direction during the PM peak hour.

### 12.6 Network Performance Summary

The network performance results shown below in **Table 12-20**, provide a good assessment of overall operations within the study area and will be used for comparison with future conditions. Latent demand and latent delay apply to vehicles that cannot enter the network due to queuing and provide a good indication of capacity constraints within the model. There were only two unserved vehicles in the AM and PM peak periods, which is most likely due to minor driveways or high volume, single-lane inputs. Vissim tends to report unserved vehicles on higher volume, single-lane inputs despite there not being any queuing present that would prevent vehicles from entering the network.

Table 12-20 Existing Conditions Vissim Network Performance Summary

Peak Period	Average Speed (mph)	Average Delay (sec)	Total Travel Time (hr)	Total Delay (hr)	Arrived Vehicles (veh)	Latent Demand (veh)	Latent Delay (hr)	Total Delay + Latent Delay (hr)

EXISTING CONDITIONS TRAFFIC TECHNICAL MEMORANDUM

# Traffic Methodology Statement

## I-75 Express Lanes Master Plan Study in Lee and Collier Counties

The purpose of this Statement is to summarize the process that will be employed to produce existing (2019) and design year (2045) annual average daily traffic (AADT) and peak hour volumes at key intersections for each interchange area along I-75 in Lee and Collier Counties.

### A. Data Collection

- 1) Thirty-seven (37) 72-hour bi-directional (approach and departure volumes at 15-minute increments) machine classification counts, one hundred and forty-six (146) 72-hour bi-directional (approach and departure volumes at 15-minute increments) machine volume counts, and one hundred and thirty-nine (139) 2-hour AM (from 7:00 AM to 9:00 AM) and PM (from 4:00 PM to 6:00 PM) turning movement, pedestrian, and bicycle counts were collected for the study area.
- 2) FDOT counts were collected as needed from Florida Traffic Online. These counts were used for the I-75 mainline in particular.

### B. Traffic Factors

- 1) An axle adjustment factor (AF) and a seasonal factor (SF) will be applied to all machine counts as appropriate.
- 2) In accordance with the FDOT "Project Traffic Forecasting Handbook", as arterials, collectors, and limited access facilities in an urbanized area, the Standard K-factor of 9.0 percent is recommended.
- 3) The calculated D-factors from the turning movement counts/tube counts will be used as seed D-factors for the I-75 mainline and cross streets, while using the low to high  $D_{30}$  factors from the FDOT "Project Traffic Forecasting Handbook" as the minimum and maximum values.
- 4) The T-factor will be calculated based on the weighted averages from the 72-hour class counts for the I-75 mainline and cross streets for each interchange area.
- 5) The AM and PM peak hours will be computed for the entire subarea network using all collected tube counts. Localized peak hours will be calculated for each of the interchange areas.

### C. Existing Year (2019) Design Traffic Volume Development

- 1) 72-hour tube counts will be reviewed for outlier days. That is, the AM and PM peak hour volumes for each day will be compared to the other two days for that count location. If one of the counts differs from the average of the two highest days by more than five (5) percent, then it is excluded. If multiple days meet this criterion then the outlier may be the higher value so each value is instead compared to the average of the two minimum days.
- 2) Significant imbalances between turning movement counts (TMCs) will be identified as potential sink/source locations. For these locations, a review of the aerial photos and maps will be conducted to determine if there is cause for adding a sink/source (e.g., a neighborhood connection, driveways) to the network. These sink/source locations will not necessarily represent an individual driveway, but may represent multiple driveways (similar to a centroid connector in a regional travel demand model). The calculated imbalance between observed

count data will be used to understand if the source/sink is an overall producer or attractor during a given period. A review of land use and engineering judgement will be used to compute the quantity of trips. Both the “*FDOT Project Traffic Forecasting Handbook*” and the “*Transportation Research Board (TRB) National Cooperative Highway Research Program (NCHRP) Report 765 – Analytical Travel Forecasting Approaches for Project-Level Planning and Design*” will be reviewed for methodological consistency.

- 3) An initial balancing of volumes during the system-wide peak hours on I-75 will be done using the FDOT counts at the northern and southern ends of the study area on the mainline and the tube counts collected on each ramp. The FDOT counts will be adjusted to ensure balancing. AADT will be reviewed on I-75 for quality after balancing by comparing the newly balanced volumes with the FDOT counts.
- 4) An existing network will be constructed in PTV VISUM by importing an extracted subarea from the base year of the sub-area validated District 1 Regional Planning Model (D1RPM). Speeds and capacities from the D1RPM will be used directly as available.
- 5) Additional driveways will be added to the D1RPM derived VISUM network where counts have been collected but the driveway does not exist in the model.
- 6) Zones will be created at all external locations on the network in VISUM. These zones will serve as the origins and destination points for the subarea. The number of AM and PM peak hour production and attraction trips at each of these zones will be computed directly from observed tube counts. If a tube count is not available at one of these zones, the appropriate approach from the turning movement count will be used instead. For those zones identified previously as a sink/source, the productions and attractions computed for that location will be used.
- 7) The productions and attractions for these zones that have been computed will then be balanced. Since the study area is a closed system, all trips entering the system must also leave the system. This same logic also applies to each interchange in the study area. By balancing the productions and attractions at each interchange and then balancing them together as a system (always upwards), no trips will be lost. This will result in a balanced set of production and attractions.
- 8) Balancing of the existing volumes will be completed using the TFLOW Fuzzy application in PTV VISUM. TFLOW Fuzzy is a matrix manipulation tool design to take an existing origin-destination matrix and adjust it so that the resulting assignment of that matrix matches the input attributes - turning movement, link, and zone counts. An overview of this process is provided in **Figure 1** below. In addition to a balanced set of turning movement counts, this volume balancing process also results in an existing year origin-destination matrix for the study area validated to the collected traffic counts.

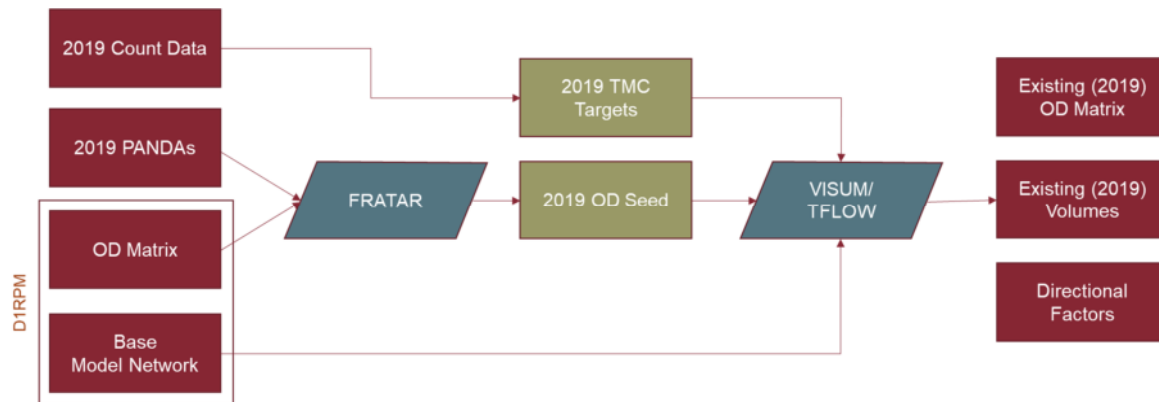

Figure 1: Existing Volumes Balancing Process

- 9) A seed origin-destination matrix will be created for each of the two peak hours (AM and PM). This seed origin-destination matrix will be produced using a sub-area origin-destination matrix extraction from the D1RPM base year to ensure that general travel patterns observed in the D1RPM will be replicated in the more detailed origin-destination matrix developed using TFLOW Fuzzy. To accomplish this, a lookup table between the zones in the subarea extraction and the VISUM network zones will be created. For places where the two models do not match (i.e., added driveways), either a nearby TAZ or roadway link will be substituted. This subarea extracted origin-destination matrix from the D1RPM will be matched to the counted origins and destinations at the external zones using iterative proportional fitting (IPF) methods outlined in NCHRP report 765 “Analytical Travel Forecasting Approaches for Project-Level Planning and Design”. These seed origin-destination matrices will be used as inputs to TFLOW Fuzzy.
- 10) Attribute files, used as inputs to TFLOW Fuzzy, will be developed for all turning movement counts, tube counts, and zone origins and destinations. These attribute files define systemwide AM and PM peak hour count values at these locations, which is then used by TFLOW Fuzzy to manipulate the seed origin-destination matrix to match the peak hour counts within defined tolerances.
- 11) An iterative process starting with the most “fuzzy” tolerance of volumes to counts and ending at a more narrow tolerance will be used to match the origin-destination matrix to the collected counts. A final consistency check on all turning movement counts and tube counts by direction will be done by ensuring that the difference between the processed volume and count does not exceed 10% and 35 trips. These metrics are based on our engineering judgement and would generally be in line with traditional volume balancing techniques. In addition to this movement level check, a systemwide check that the difference between all counts and VISUM processed turning movement volumes is less than 5 percent to meet the VISSIM calibration criteria provided in Table 7-7 of the “FDOT Traffic Analysis Handbook.”
- 12) In addition to validation of the count values for turning movement counts, relative flows at the TMCs will also be checked to confirm there are no significant changes that might point to changes in distribution patterns.
- 13) In addition to our individual count level threshold, a final QC check will be performed at each external zone in the VISUM model. AADT will be re-calculated from the maximum of the AM and PM peak hourly volumes at each study segment using a standard K factor and the count specific D factor. This modeled AADT will be compared to the counted AADT value. To measure these differences, percent root mean square error (RMSE) values defined in the FDOT “Project Traffic

*Forecasting Handbook*” will be used to define what tolerance is acceptable or preferred. **Equation 1** below defines the process for calculating percent RMSE and **Table 1** below provides the traffic assignment accuracy levels. This practice is in line with typical validation techniques for travel demand models in the State of Florida. Differences in AADT exceeding 10 percent on links, with an AADT greater than 1,000, will be reviewed to ensure the change in volume is appropriate based on engineering judgement.

- 14) Access and egress for I-75 is a key component of this study. As such, special care will be taken in validating ramp volumes.

**Equation 1: Percent RMSE Calculation**

$$\%RMSE = \frac{(\sum_j (Model_j - Count_j)^2 / (NumberofCounts - 1))^{0.5} * 100}{(\sum_j Count_j / NumberofCounts)}$$

**D. No Build 2040 Traffic Forecasts**

- 1) **Figure 2** below outlines the 2040 No-Build Forecasting Approach.

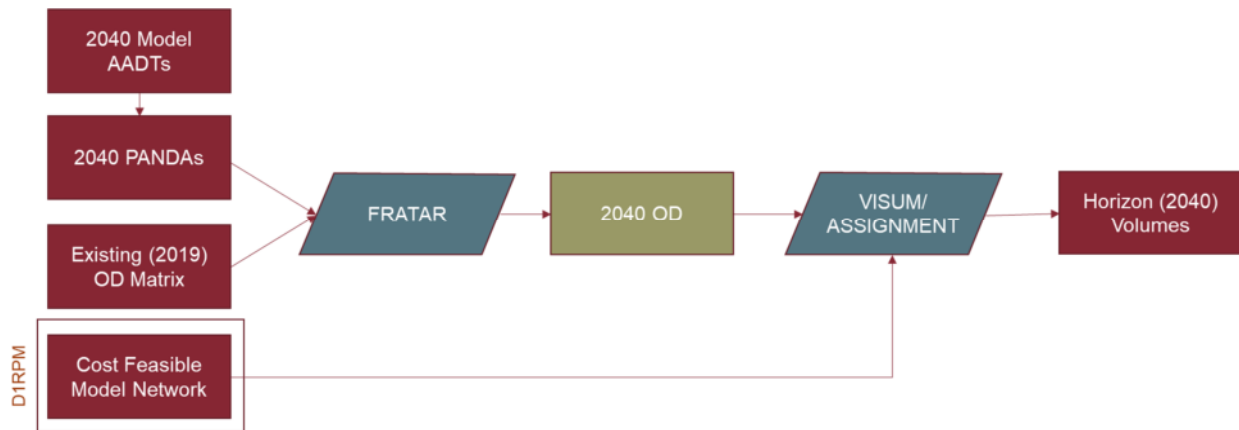

Figure 2: No-Build 2040 Forecasting Approach

- 2) The Department provided version of the District 1 Regional Planning Model (D1RPM), with the base year 2015, will be used to develop design traffic forecasts. Growth will be observed in the model outputs between the base year (2015) and horizon year (2040). This analysis, along with count site trends and socio-economic growth will form the basis for identifying future growth rates. Using direct model volumes will be preferred with model output correction factors (MOCF) from FDOT applied as necessary. In cases where there are unexpected variations in growth, variations will be documented and conveyed to the Department and IPM.
- 3) The no-build demand volumes will be based upon the D1RPM CF network, with I-75 (within the bounds of the D1RPM) coded as a 10-lane general use scenario, to establish unconstrained demand as the basis for analysis. This unconstrained scenario will ensure that latent demand is adequately captured.
- 4) Horizon year (2040) Model AADTs at network inputs will be collected and approved existing volume D-factors (for a given period) and standard K will be applied to develop a forecasted set of productions and attractions. This matrix will then be balanced (always up) to ensure no loss in the system.
- 5) The horizon year origin-destination matrix will be developed using a FRATAR process using the existing origin-destination matrix and the horizon year productions and attractions as the target.

The resulting horizon year origin-destination matrix will be assigned (using 20 iterations) to a year 2040 VISUM network which will be derived from the 2040 cost-feasible network included in the validated D1RPM using capacities and speeds from the model network as available. The resulting network will be reviewed for reasonableness and consistency.

- 1) **Figure 3** below outlines the 2045 No-Build Forecasting Approach.

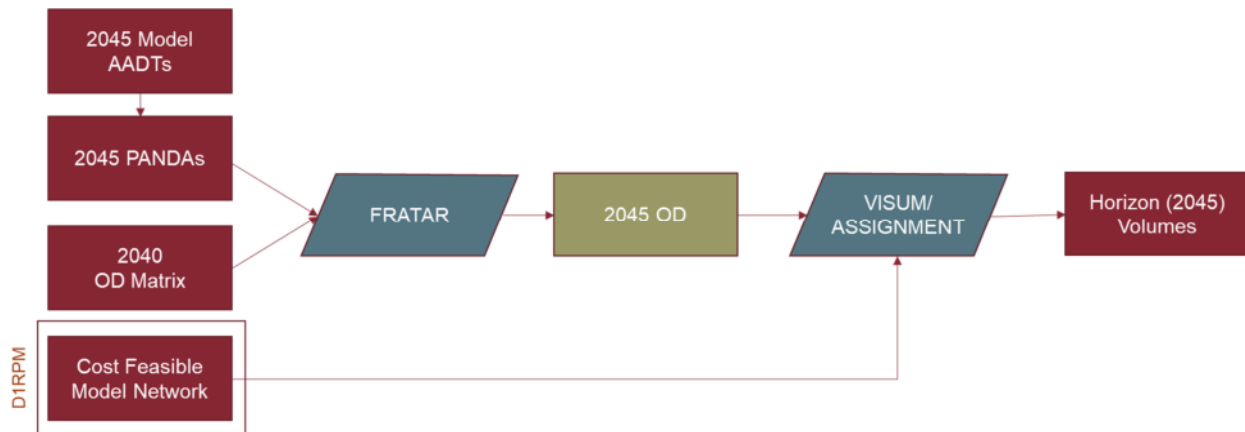

Figure 3: No-Build 2045 Forecast Procedure

- 2) Once it is agreed that the procedure is accurately portraying network assignment and is consistent with model forecasts, the 2019 and 2040 PANDAs will be linearly interpolated at each count site to develop 2045 PANDAs. These PANDAs will again be balanced (always up) and then will use the Fratar process to develop 2045 OD matrices utilizing the 2040 matrices as their seed.
- 3) The resultant 2045 OD matrices will then be assigned (20 iterations) to the network in VISUM utilizing user equilibrium assignment. The resulting network assignment will be reviewed for reasonableness and forecast consistency.
- 4) Input and turning movement volumes will be reviewed to ensure growth between the 2040 and 2045. Where negative growth is observed, route choice will be checked to note whether route diversion is the reason for distribution change or if additional action is required. D-Factors at network inputs will again be checked for reasonableness against Table 2-2 in the Project Traffic Forecasting Handbook (PTFH).

#### F. Build 2045 Traffic Forecasts

- 1) The D1RPM developed to support this effort will include three alternatives. The first alternative will be the 2040 cost-feasible network, the second alternative will be the 2040 cost-feasible network with one additional lane on I-75. The second alternative will be the 2040 cost-feasible network with two additional lanes on I-75.
- 2) Build alternative testing will consist of manipulating network coding and reassigning to the network via user equilibrium assignment as prescribed in the previous step.
- 3) Any changes in demand along corridors within the network will be documented and provided for Department review.
- 4) Any interim assignment needed will be developed by linearly interpolating between the 2019 and 2045 PANDAs, then applying the Fratar procedure with the 2045 OD matrices serving as the seed for development. Assignment will again be via user equilibrium assignment and developed traffic characteristics will be checked for forecast consistency and reasonableness as previously documented.

#### E. Documentation

- 1) At each of the following steps, quality control documentation will be provided to the Department for review. This documentation will include the quality checks referred to in this methodology and will be presented to the Department in a way that will facilitate review.
  - a. Existing Volume Development
  - b. 2040 No-Build Volume Development
  - c. 2045 No-Build Volume Development
- 2) All volume development and traffic forecasts outlined above will be documented in a Project Traffic Development Memorandum. The following scenarios will be developed for this effort:
  - a. Existing (2019)
  - b. No Build (2025 and 2045)
  - c. Build A 'Phase 1' (2025 and 2045)
  - d. Build B 'Phase 2' (2025 and 2045)
  - e. Build C 'Ultimate' (2025 and 2045)

# Appendix B

## Safety Methodology Statement

**I-75 SOUTH CORRIDOR MASTER PLAN**

---

EXISTING CONDITIONS TRAFFIC TECHNICAL MEMORANDUM

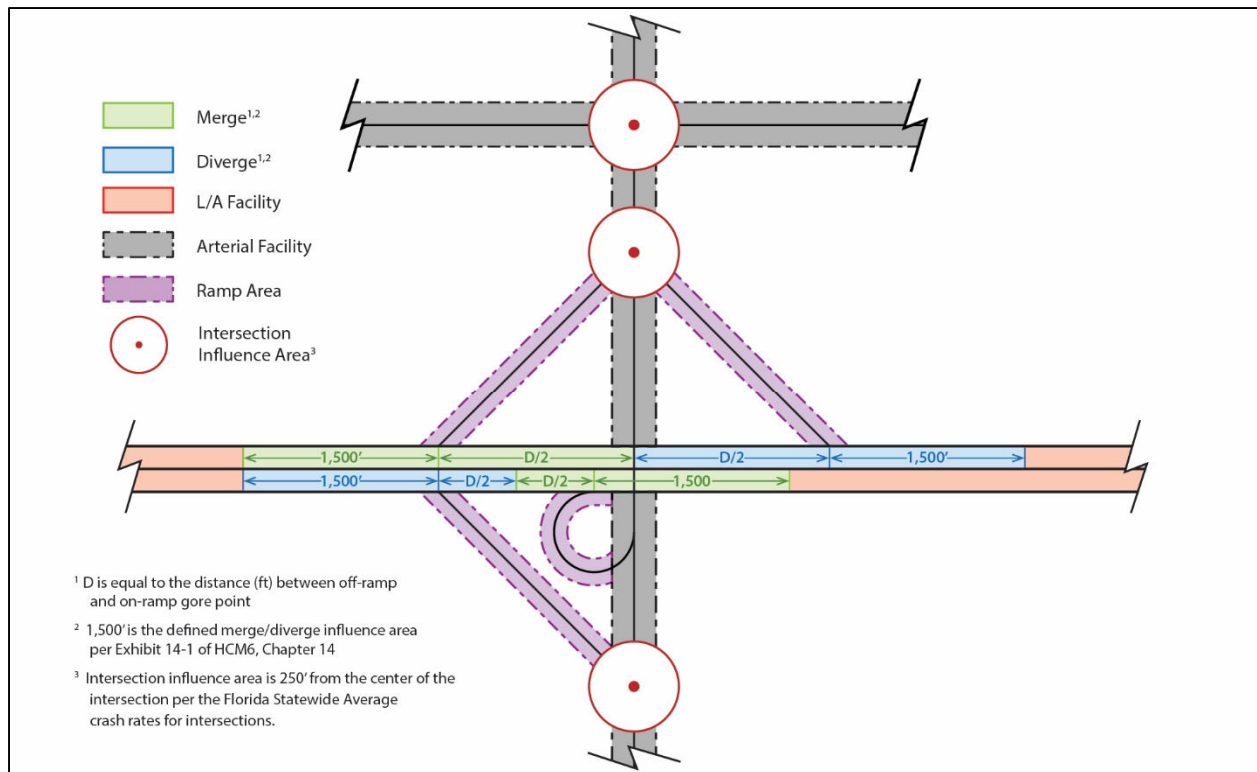

# Safety Methodology Statement

## I-75 Express Lanes PD&E Study in Lee and Collier Counties

The purpose of this Statement is to summarize the process that will be employed to collect crash data and determine areas with a high crash frequency for the existing corridor along I-75 south of Collier Boulevard to north of Bayshore Road. Additionally, future predicted crash rates will be determined based on proposed improvements along the corridor. The methodology will be based on the predictive method for freeways, which is included in the 2014 supplement to the 1<sup>st</sup> Edition of the *Highway Safety Manual* (HSM). The predictive method will allow for a safety comparison between alternatives based on proposed design elements, operational treatments, and future growth on the facility.

### A. Crash Data Collection

- 1) Crash data will be collected from the Florida Department of Transportation (FDOT) Crash Analysis Reporting System (CARS) along mainline I-75 and state facilities and from the University of Florida's Signal Four Analytics for non-state roads for the 5 most recent years. Crash data will be obtained for the I-75 mainline from south of Collier Boulevard to north of Bayshore Road and for each of the following cross streets:
  - Collier Boulevard
  - Santa Barbara Boulevard (Proposed)
  - Golden Gate Parkway
  - Pine Ridge Road
  - Vanderbilt Beach Road (Proposed)
  - Immokalee Road
  - Bonita Beach Road
  - Corkscrew Road
  - Alico Road
  - Terminal Access Road
  - Daniels Parkway
  - Colonial Boulevard
  - Martin Luther King Jr Boulevard
  - Lockett Road
  - State Road 80
  - Bayshore Road
  
- 2) The crash data will be divided into analysis areas as found in **Figure 1** and will fall into one of the following location types:
  - Intersections
  - Arterial Facilities
  - Merge/Diverge Influence Areas
  - Ramp Areas
  - Limited Access Facilities

**Figure 1:** Crash Analysis Areas

## B. Crash Characteristics

- 1) Crash data for each location will be divided by crash type. Crash types may consist of, but are not limited to, any of the following: angle, rear-end, sideswipe, head-on, hit fixed object, pedestrian, and bicycle related crashes. Crash types will be summarized in tabular format by time of day.
- 2) Crash data for each location will be divided by weather condition. Weather conditions may consist of, but are not limited to, any of the following: clear, rain, and cloudy. Crashes by weather condition will be summarized in a tabular format by time of day.
- 3) Crash data for each location will be divided by lighting condition. Lighting conditions may consist of, but are not limited to, any of the following: daylight, dark-lighted, dark-not lighted, dawn, and dusk. Crashes by lighting condition will be summarized in a tabular format by time of day.
- 4) Crash data for each location will be divided by injury severity, as defined by the FDOT KABCO crash costs from the FDOT Design Manual. Injury severities consist of the following: property damage only, minor injury, moderate injury, severe injury, and fatality. Using the KABCO crash costs, the economic loss to society for each crash severity type will be determined from the crash data. Crash severity for the analysis period as a whole will be summarized in tabular format by time of day, and crash severity trends over time will be summarized as a graph. Locations where pedestrian related, bicycle related, and/or fatal crashes occurred will be further analyzed for potential causes and/or patterns. This analysis will include a more thorough written description of the long-form crash report.

- 5) Crash data for each interchange will be summarized by three heat maps to show locations of relatively high and low crash frequency within the interchange (one for northbound I-75, one for southbound I-75, and one for the surface street intersections with the I-75 ramps). Crashes involving bicycles, pedestrians, severe injuries, or fatalities will be diagrammed individually to show their general location.

### C. Crash Ratios

- 1) Crash rates will be calculated for each location using the following formula<sup>1</sup>:

$$\text{Crash Rate} = \frac{1,000,000 * [5 \text{ Year Total Crashes}]}{365 * [\text{Number of Years}] * [5 \text{ Year Average AADT}] * \text{Segment Length (mi)}}$$

The resulting crash rate will be divided by the state and districtwide average for each location based on its facility and area type to determine the state and districtwide crash ratios.

- 2) A state or districtwide crash ratio of greater than 1.0 indicates the location has a greater crash frequency than the statewide average. Locations with a crash ratio of greater than 1.0 will be further analyzed to determine if an underlying crash cause is present.

### D. Predictive Crash Analysis

If required by the January 2018 Interchange Access Request Users Guide, predictive crash analysis will be performed as described below.

- 1) All relevant geometric data on segments and ramps will be identified as inputs to the predictive method (e.g., number of through lanes, lane width, shoulder widths, clear zones, etc.)
- 2) Crash data collected and summarized in Parts B and C above will be assigned to the appropriate segment or ramps per criteria outlined in Section B.2.3 of Appendix B of the HSM.
- 3) AADTs collected and summarized in Parts B and C above will be assigned to each segment and ramp.
- 4) The appropriate safety performance functions (SPF), from Chapters 18 and 19 of the 2014 supplement to the latest HSM will be identified for each freeway segment and interchange.
- 5) Appropriate crash modification factors (CMF) will be identified for each segment and interchange. These CMFs will come from Chapters 18 and 19 of the 2014 supplement to the latest HSM if available, or from the FHWA Crash Modification Factor Clearinghouse if not.
- 6) Calibration factors for SPF's found in Chapters 18/19 of the HSM (freeways and interchanges) are not listed on FDOT's Safety Website. The latest calibration factors are dated 2012, prior to the release of the 2014 supplement to the HSM which contained Chapters 18 and 19. A cursory review of recent PD&E studies has not indicated whether or not the predictive method has been used on freeways or interchanges in the State and it is unclear if calibration factors have been developed in the past five years. The HSM indicates that 30 to 50 sites are necessary to develop a calibration

---

<sup>1</sup> Based on the FHWA crash rate calculation formula. However, FDOT calculates its crash rates in terms of million vehicle miles traveled (VMT) for segments rather than 100,000,000 VMT, so 1,000,000 is used as a constant for both equations.

factor. For freeways, this would be 0.1 to 1.0 mile lengths. Crash data, volumes, and other data needed to use the predictive method must be available for the past three years for each site type. For each site type, a minimum of 300 fatal or injury crashes must be included and additional sites must be included until that minimum number is reached. Each site type corresponding to a SPF will need to be evaluated separately by number of lanes and area type.

- 7) Appendix B of the HSM will be used to identify which sites and segments the Empirical Bayes (EB) method is appropriate. Section B.2 of Appendix B indicates that the EB method is not appropriate for new alignment along a portion of the project length; however, the EB method may be applied at sites where it is appropriate (i.e., the EB method does not need to be applied in an all-or-nothing fashion).
- 8) If required by the January 2018 Interchange Access Request Users Guide, the EB Method, outlined in Sections B.2.4 and B.2.6 of Appendix B of the HSM 2014 Supplement will be used as appropriate to leverage the combination of observed crash frequency (using historical data) and predicted crash frequency (using an SPF) to determine a more reliable expected average crash frequency that accounts for both the variability in sites used to develop an SPF and the inherent variability in observed crash data. The resulting expected average crash frequency will be used in further safety analysis in the same fashion that observed crash frequency would be used, and also to predict crash frequency in future years as appropriate.
- 9) Fatal/injury crash rates and property-damage only crash rates will be calculated, as described above for each scenario.
- 10) Crash Severity Distribution Functions (SDF) will be used to further quantify the crash frequency by the KABCO crash types defined in Section B.4 above.

The following table from the January 2018 Interchange Access Request Users Guide describes the instances in which we would utilize the EB Method, SPFs, and/or CMFs:

**Table 3-1: Safety Analysis Types**

<b>IJR</b>	Calculation of Crash Rates	Crash Diagrams	Description of Existing Crash Trends	Safety Performance Functions	→	Crash Reduction Estimation (CMF's)	Benefit Cost Analysis (Optional)	Documentation
<b>IMR</b>	Calculation of Crash Rates	Crash Diagrams	Description of Existing Crash Trends	Safety Performance Functions	Empirical Bayes Method	Crash Reduction Estimation (CMF's)	Benefit Cost Analysis	Documentation
<b>IOAR</b>	Calculation of Crash Rates	Crash Diagrams	Description of Existing Crash Trends	→	→	Crash Reduction Estimation (CMF's)	→	Documentation
<b>Existing Conditions</b>	Calculation of Crash Rates	Crash Diagrams	Description of Existing Crash Trends	→				Documentation

E. Documentation

- 1) All crash data, analysis, and predictive crashes outlined above will be documented in a *Crash Data and Safety Analysis Technical Memorandum*.

# Appendix C

## Traffic Analysis Memorandum of Agreement

**I-75 SOUTH CORRIDOR MASTER PLAN**

---

EXISTING CONDITIONS TRAFFIC TECHNICAL MEMORANDUM

# Memo

Date: Tuesday, June 9, 2020

Project: I-75 from East of SR 951 (Collier Blvd) to SR 78 (Bayshore Rd) PD&E  
FPIDs: 442519-2 and 442519-3

To: Joshua Jester, FDOT

From: Smith Siromaskul, HDR

Subject: Traffic Analysis Memorandum of Agreement (MOA)

## 1. Purpose of the Memorandum of Agreement (MOA)

The Memorandum of Agreement (MOA) is being prepared based on discussions that occurred on November 22, 2019, between FDOT District One and the I-75 PD&E team. During this meeting, it was established that we are too early in the project process to have all of the information needed to develop a Methodology Letter of Understanding (MLOU).

The project area for this first of two I-75 corridor projects spans multiple counties and over 40 miles of I-75. The length of the corridor creates complications in the project process that this MOA is intended to address as there are elements on which concurrence should be obtained at this time instead of waiting until such time as an MLOU and subsequent SIMR can be developed.

The MOA outlines how analysis and documentation will be conducted for this study. The intent of the MOA is

- To document traffic operational analysis and traffic forecasting methodologies to be followed during the preliminary analysis phase of the I-75 PD&E Study. The preliminary analysis phase is defined as the phase where the I-75 PD&E team identifies the ultimate design for the corridor. This analysis will be summarized in a Traffic Technical Memo.
- To obtain concurrence from FDOT District One on traffic operational analysis and traffic forecasting methodologies, including traffic analysis tools to be used for the duration of the I-75 PD&E Study.

The preliminary analysis phase will help determine how the interchanges will be grouped, leading to Interchange Access Request (IAR) actions including SIMRs, IMRs, IOARs and IJR. Further alternatives for each IAR action will be determined based on the coordination with FDOT Central Office and FDOT District One during the MLOU stage consistent with the latest Interchange Access Request Users Guide (IARUG). Discussions about the appropriate level of IAR documentation for interchanges within the study area, will continue as the preliminary analysis phase progresses and more information becomes available. While deterministic tools will be used during the project for concept development purposes, the simulation models cover the entirety of the project area. In an effort to not duplicate efforts, we are proposing to report measures of effectiveness from simulation modeling. Additional discussion is in Section 10.

From an overall project perspective, we believe that the ultimate full corridor preferred alternative configuration must be determined as the initial aspects of the overall two-County Study. This needs to cover the entire corridor without regard to order of implementation or segmentation of the project into implementable pieces, because following construction under any phased implementation scenario, the whole of the corridor-wide improvements needs to work comprehensively together in the full build scenario. This ultimate solution needs to be based on the ultimate travel demand for the design year. This would represent the first traffic operational analysis scenario and we can refer to this as the ultimate design.

Subsequent to determining the ultimate design, we need to do two things:

- Identify the order in which the existing conditions will fail
- Find a way to segment the ultimate design into standalone projects that can be implemented while fitting into the ultimate framework with limited throwaway, and that have the ability to be operable on their own from a phased implementation scenario

This methodology will help determine how we should separate the interchanges into packages and the appropriate IAR documentation that would be associated with those groupings. This leads to our recommendation that a decision on how to segment the corridor should be made after determining the ultimate condition, and of course in part on the anticipated staggered programming of final design and construction funding. The ultimate condition would be determined via traffic operational analysis of the corridor as a whole.

## **2. Project Description**

FDOT District One recently initiated a Project Development and Environment (PD&E) study for Interstate 75 (I-75) in Lee County and Collier County. The study limits in Collier County start from east of SR 951 to the Collier/Lee County Line (13.6 miles). The study limits in Lee County start from the Collier/Lee County Line to North of SR 78 (Bayshore Road) (28.6 miles). The PD&E study spans 42.2 miles in length and traverses the major urban areas of Naples and Fort Myers in southwest Florida. I-75 also crosses the navigable Caloosahatchee River in Lee County, just south of SR 78 (Bayshore Road) [the northern project limit]. It should be noted that the PD&E study is not a re-evaluation.

The project segment of I-75 consists of a six-lane divided typical section with a maximum posted speed limit of 70 miles per hour. The functional classification of I-75 within PD&E study limits is Urban Principal Arterial – Interstate. Existing right-of-way (ROW) along the corridor ranges from approximately 300 feet to 750 feet in width. While the proposed improvements are anticipated to be constructed primarily within the existing right-of-way, some additional right-of-way may be required, particularly around the interchanges. Specific right-of-way requirements will be determined during the PD&E Study.

This capacity improvement project involves the potential construction of managed lanes in each direction on I-75. Additional general use lanes, collector-distributor roadways, and auxiliary lanes, as well as interchange operational improvements, are also being considered. As such, up to a fourteen-lane typical section is being explored. There are also opportunities to

operate reliable, efficient transit service within the managed lanes, as well as to provide connections to park and ride or kiss and ride lots located within the project area. Further, there is opportunity to provide improved or new bicycle and pedestrian accommodations as well as landscaping/streetscaping treatments on roadways connecting to or passing under the interstate to enhance bicycle and pedestrian circulation and access to area transit service.

### 3. Purpose and Need Statement

The purpose of the PD&E project is to address the deficient operational capacity of I-75, also known as Florida's State Road (SR) 93, from east of SR 951 (Collier Boulevard) in Collier County to SR 78 (Bayshore Road) in Lee County in order to accommodate future travel demand projected as a result of population and employment growth along the corridor. The capacity deficiency is not existing but is expected to occur before the design year. The project will evaluate the potential addition of managed lanes, including supporting additional general use lanes, collector-distributor roadways, and auxiliary lanes; interchange operational improvements will also be considered.

Other goals of the project are to:

1. Preserve the operational integrity and regional functionality of I-75 (and, therefore, the regional transportation network) by complementing similar corridor improvements to the north, and
2. Enhance emergency evacuation and response times.

The need for this project is based on the following criteria:

Capacity: The project is anticipated to improve traffic operations along I-75 by increasing capacity and better dispersing traffic (i.e., separating managed lanes traffic from general use traffic). The traffic dispersal and reduced congestion can decrease vehicle conflicts and, therefore, enhance travel conditions of the corridor. I-75 within the project limits currently operates at Level of Service (LOS) A to C, with annual average daily traffic volumes ranging from 43,500 vehicles per day to 102,000 vehicles per day. Traffic volumes on the corridor are projected to increase to between 66,000 and 155,000 vehicles per day by 2045. Without improvements, the driving conditions will deteriorate below acceptable LOS targets.

Safety: I-75 serves as part of the emergency evacuation route network designated by the Florida Division of Emergency Management. Also designated as an evacuation facility of Collier and Lee Counties, I-75 is vital in facilitating traffic during emergency evacuation periods as it connects to other major arterials and highways of the state evacuation route network [such as SR 951 (Collier Boulevard) and SR 78 (Bayshore Road)]. The project is anticipated to:

- Improve emergency evacuation capabilities by enhancing connectivity and accessibility to other major arterials designated on the state evacuation route network, and
- Increase the volume of traffic that can be evacuated during an emergency event.

System Linkage: As part of Florida's Strategic Intermodal System (SIS) highway network, I-75 plays a significant role in facilitating commuter, visitor, and freight traffic within the state. The proposed project improvements are part of a larger, regional set of projects on the interstate

system to the north (in Charlotte, Sarasota, Manatee, Hillsborough, Pinellas, and Polk Counties) that are considering managed lanes and additional general purpose lanes, auxiliary lanes, etc. to increase the operational capacity of not only I-75, but I-4 and I-275 as well.

The intent is for all of these project improvements to work together to improve the overall reliability and performance of the interstate system in moving high volumes of goods and people at efficient speeds. It is important to note that managed lanes also create an opportunity for the provision of efficient and reliable transit service. As such, these improvements are critical to enhancing regional mobility. They are also key in preserving the operational integrity and regional functionality of the I-75 corridor as a whole.

## 4. Project Limits

This project is located along I-75 from east of SR 951 (Collier Boulevard) in Collier County to SR 78 (Bayshore Road) in Lee County. The study area is shown in **Figures 1, 2, and 3**. The study limits in Collier County start from east of SR 951 to the Collier/Lee County Line (13.6 miles). The study limits in Lee County start from the Collier/Lee County Line to North of SR 78 (Bayshore Road) (28.6 miles). The PD&E study spans 42.2 miles in length and traverse the major urban areas of Naples and Fort Myers in southwest Florida. The study area includes fourteen existing interchanges and two potential interchanges. The on-and off-ramps and merge/diverge areas for the existing interchanges are encompassed along I-75. The arterial intersections are listed below:

### I-75 at SR 951 (Collier Boulevard)

- Collier Blvd & Golden Gate Parkway
- Collier Blvd & 25th Ave SW
- Collier Blvd & City Gate Blvd
- Collier Blvd & Magnolia Pond Dr
- Collier Blvd & I-75 NB Ramps
- Collier Blvd & I-75 SB Ramps
- Collier Blvd & Davis Blvd
- Collier Blvd & Business Cir
- Davis Blvd & Market St
- Radio Rd & Davis Blvd
- Radio Rd & Madison Park Blvd

### I-75 at Santa Barbara Boulevard (Proposed)

- Golden Gate Pkwy & Santa Barbara Blvd
- Santa Barbara Blvd & Painted Leaf Ln
- Santa Barbara Blvd & Prince Andrew Blvd
- Santa Barbara Blvd & Radio Rd

### I-75 at Golden Gate Parkway

- Golden Gate Parkway & Livingston Rd
- Golden Gate Parkway & 68th St SW
- Golden Gate Parkway & 66th St SW
- Golden Gate Parkway & I-75 SB Ramps
- Golden Gate Parkway & I-75 NB Ramps
- Golden Gate Parkway & 60th St SW
- Golden Gate Parkway & 58th St SW

- Golden Gate Parkway & 55th St SW
- Golden Gate Parkway & 53rd St SW
- Golden Gate Pkwy & Santa Barbara Blvd
- Santa Barbara Blvd & Painted Leaf Ln
- Santa Barbara Blvd & Prince Andrew Blvd
- Santa Barbara Blvd & Radio Rd

#### I-75 at Pine Ridge Road

- Pine Ridge Rd & Livingston Rd
- Livingston Rd & Driveway (shopping center)
- Pine Ridge Rd & Driveway (shopping center)
- Pine Ridge Rd & Meridian Pl
- Pine Ridge Rd & Kraft Rd
- Pine Ridge Rd & Whippoorwill Ln
- Whippoorwill Ln & Dudley Dr
- Pine Ridge Rd & Lawson Way
- Pine Ridge Rd & I-75 SB Ramps
- Pine Ridge Rd & I-75 NB Ramps
- Pine Ridge Rd & Napa Blvd
- Pine Ridge Rd & Vineyards Blvd
- Pine Ridge Rd & Logan Blvd

#### I-75 at Vanderbilt Beach Road (Proposed)

- Vanderbilt Beach Rd & Oakes Blvd
- Vanderbilt Beach Rd & Vineyards Blvd
- Vanderbilt Beach Rd & Logan Blvd
- Vanderbilt Beach Rd & Lakes Blvd
- Vanderbilt Beach Rd & Bermuda Isle Cir
- Vanderbilt Beach Rd & Livingston Rd

#### I-75 at Immokalee Road

- Immokalee Rd & Logan Blvd N
- Immokalee Rd & I-75 NB Ramps
- Immokalee Rd & I-75 SB Ramps
- Immokalee Rd & Tarpon Bay Blvd
- Immokalee Rd & Oakes Blvd
- Immokalee Rd & Valewood Dr
- Immokalee Rd & Strand Blvd
- Immokalee Rd & Walmart Driveway
- Immokalee Rd & Livingston Rd
- Immokalee Rd & Aston Dr
- Immokalee Rd & Lakeland Ave
- Livingston Rd & Carlton Lake Blvd
- Juliet Blvd & Useppa Way

#### I-75 at Bonita Beach Road

- Bonita Beach Rd & Bonita Grande Dr
- Bonita Grande Dr & Trade Way Three
- Bonita Grande Dr & Trade Way Dr
- Bonita Beach Rd & Trade Way Three
- Bonita Beach Rd & Trade Way Two
- Bonita Beach Rd & Trade Way One
- Bonita Beach Rd & Mille Rd

- Bonita Beach Rd & I-75 NB Ramps
- Bonita Beach Rd & I-75 SB Ramps
- Bonita Beach Rd & Oakland Dr
- Bonita Beach Rd & Downs Dr
- Bonita Beach Rd & Quinn St
- Bonita Beach Rd & Imperial Pkwy
- Bonita Beach Rd & Duck Lake Loop
- Bonita Beach Rd & Lime St
- Imperial Parkway & Dean St

#### I-75 at Corkscrew Road

- Corkscrew Rd & Three Oaks Parkway
- Three Oaks Parkway & Estero Town Commons Pl
- Corkscrew Rd & Puerto Way
- Corkscrew Rd & Puente Ln
- Corkscrew Rd & Corkscrew Woodlands Blvd
- Corkscrew Rd & Corkscrew Commons Dr
- Corkscrew Rd & I-75 SB Ramps
- Corkscrew Rd & I-75 NB Ramps
- Corkscrew Rd & Miromar Outlet Driveway
- Corkscrew Rd & Ben Hill Griffin Pkwy
- Stoneybrook Golf Blvd & Miromar Square Blvd
- Ben Hill Griffin Parkway & Driveway 1 (Miromar Outlet//Grand Oak Shoppes)
- Ben Hill Griffin Parkway & Driveway 2 (Miromar Outlet//Grand Oak Shoppes)
- Corkscrew Rd & Stoneybrook Golf Dr

#### I-75 at Alico Road

- Alico Rd & Royal Queen Blvd
- Alico Rd & I-75 NB Ramps
- Alico Rd & I-75 SB Ramps
- Alico Rd & Three Oak Parkway
- Alico Rd & Ben Hill Griffin Parkway
- Ben Hill Griffin Parkway & Hilton Garden Way
- Ben Hill Griffin Parkway & Homewood Suites Dr
- Ben Hill Griffin Parkway & Royal University Dr
- Ben Hill Griffin Parkway & Gulf Center Dr

#### I-75 at Airport Access Road

- Ben Hill Griffin Parkway & Terminal Access Rd

#### I-75 at Daniels Parkway

- Daniels Parkway & Powers Ct
- Daniels Pkwy & Weirsma Ln
- Daniels Parkway & Fiddlesticks Blvd
- Daniels Parkway & Skyport Ave Mall Loop Dr
- Daniels Parkway & Danport Blvd
- Daniels Parkway & I-75 NB Ramps
- Daniels Parkway & I-75 SB Ramps
- Daniels Parkway & Goldenwood Dr
- Daniels Parkway & Jetport Commerce Parkway
- Daniels Parkway & Treeline Ave
- Treeline Ave & Intercom Dr

- Fiddlesticks Blvd & Cody Lee Rd
- Palomino Ln & Kings Crossing Rd

I-75 at SR 884 (Colonial Boulevard)

- Colonial Blvd & Golden Corral Dr
- Colonial Blvd & Ortiz Ave
- Colonial Blvd & I-75 SB Ramps
- Colonial Blvd & I-75 NB Ramps
- Colonial Blvd & Forum Blvd
- Forum Blvd & Home Depot Driveway
- Forum Blvd & Dynasty Dr
- Ben C Praft 6 Mile Cypress Pkwy and Rolfes Rd
- Ben C Praft 6 Mile Cypress Pkwy and McDonalds Driveway
- Ortiz Ave & Colonial Center Dr

I-75 at SR 82 (MLK Boulevard)

- MLK Jr Blvd & Forum Blvd
- MLK Jr Blvd & Destination Dr
- MLK Jr Blvd & Ortiz Ave
- MLK Jr Blvd & Park 82 Dr
- MLK Jr Blvd & I-75 SB Ramps
- MLK Jr Blvd & I-75 NB Ramps

I-75 at Lockett Road

- Lockett Rd & Country Lakes Dr
- Lockett Rd & Northland Rd
- Lockett Rd & Hamilton Dr
- Lockett Rd & I-75 SB Ramps
- Lockett Rd & I-75 NB Ramps

I-75 at SR 80 (Palm Beach Road)

- Palm Beach Blvd & Orange River Blvd
- Palm Beach Blvd & 1st Street
- Palm Beach Blvd & Morse Piz
- Palm Beach Blvd & I-75 SB Ramps
- Palm Beach Blvd & I-75 NB Ramps

I-75 at SR 78 (Bayshore Road)

- Bayshore Rd & Wells Rd
- Bayshore Rd & Pritchett Parkway
- Bayshore Rd & I-75 SB Ramps
- Bayshore Rd & I-75 NB Ramps
- Bayshore Rd & Park 78 Dr

Figure 1. Project Location and Study Area

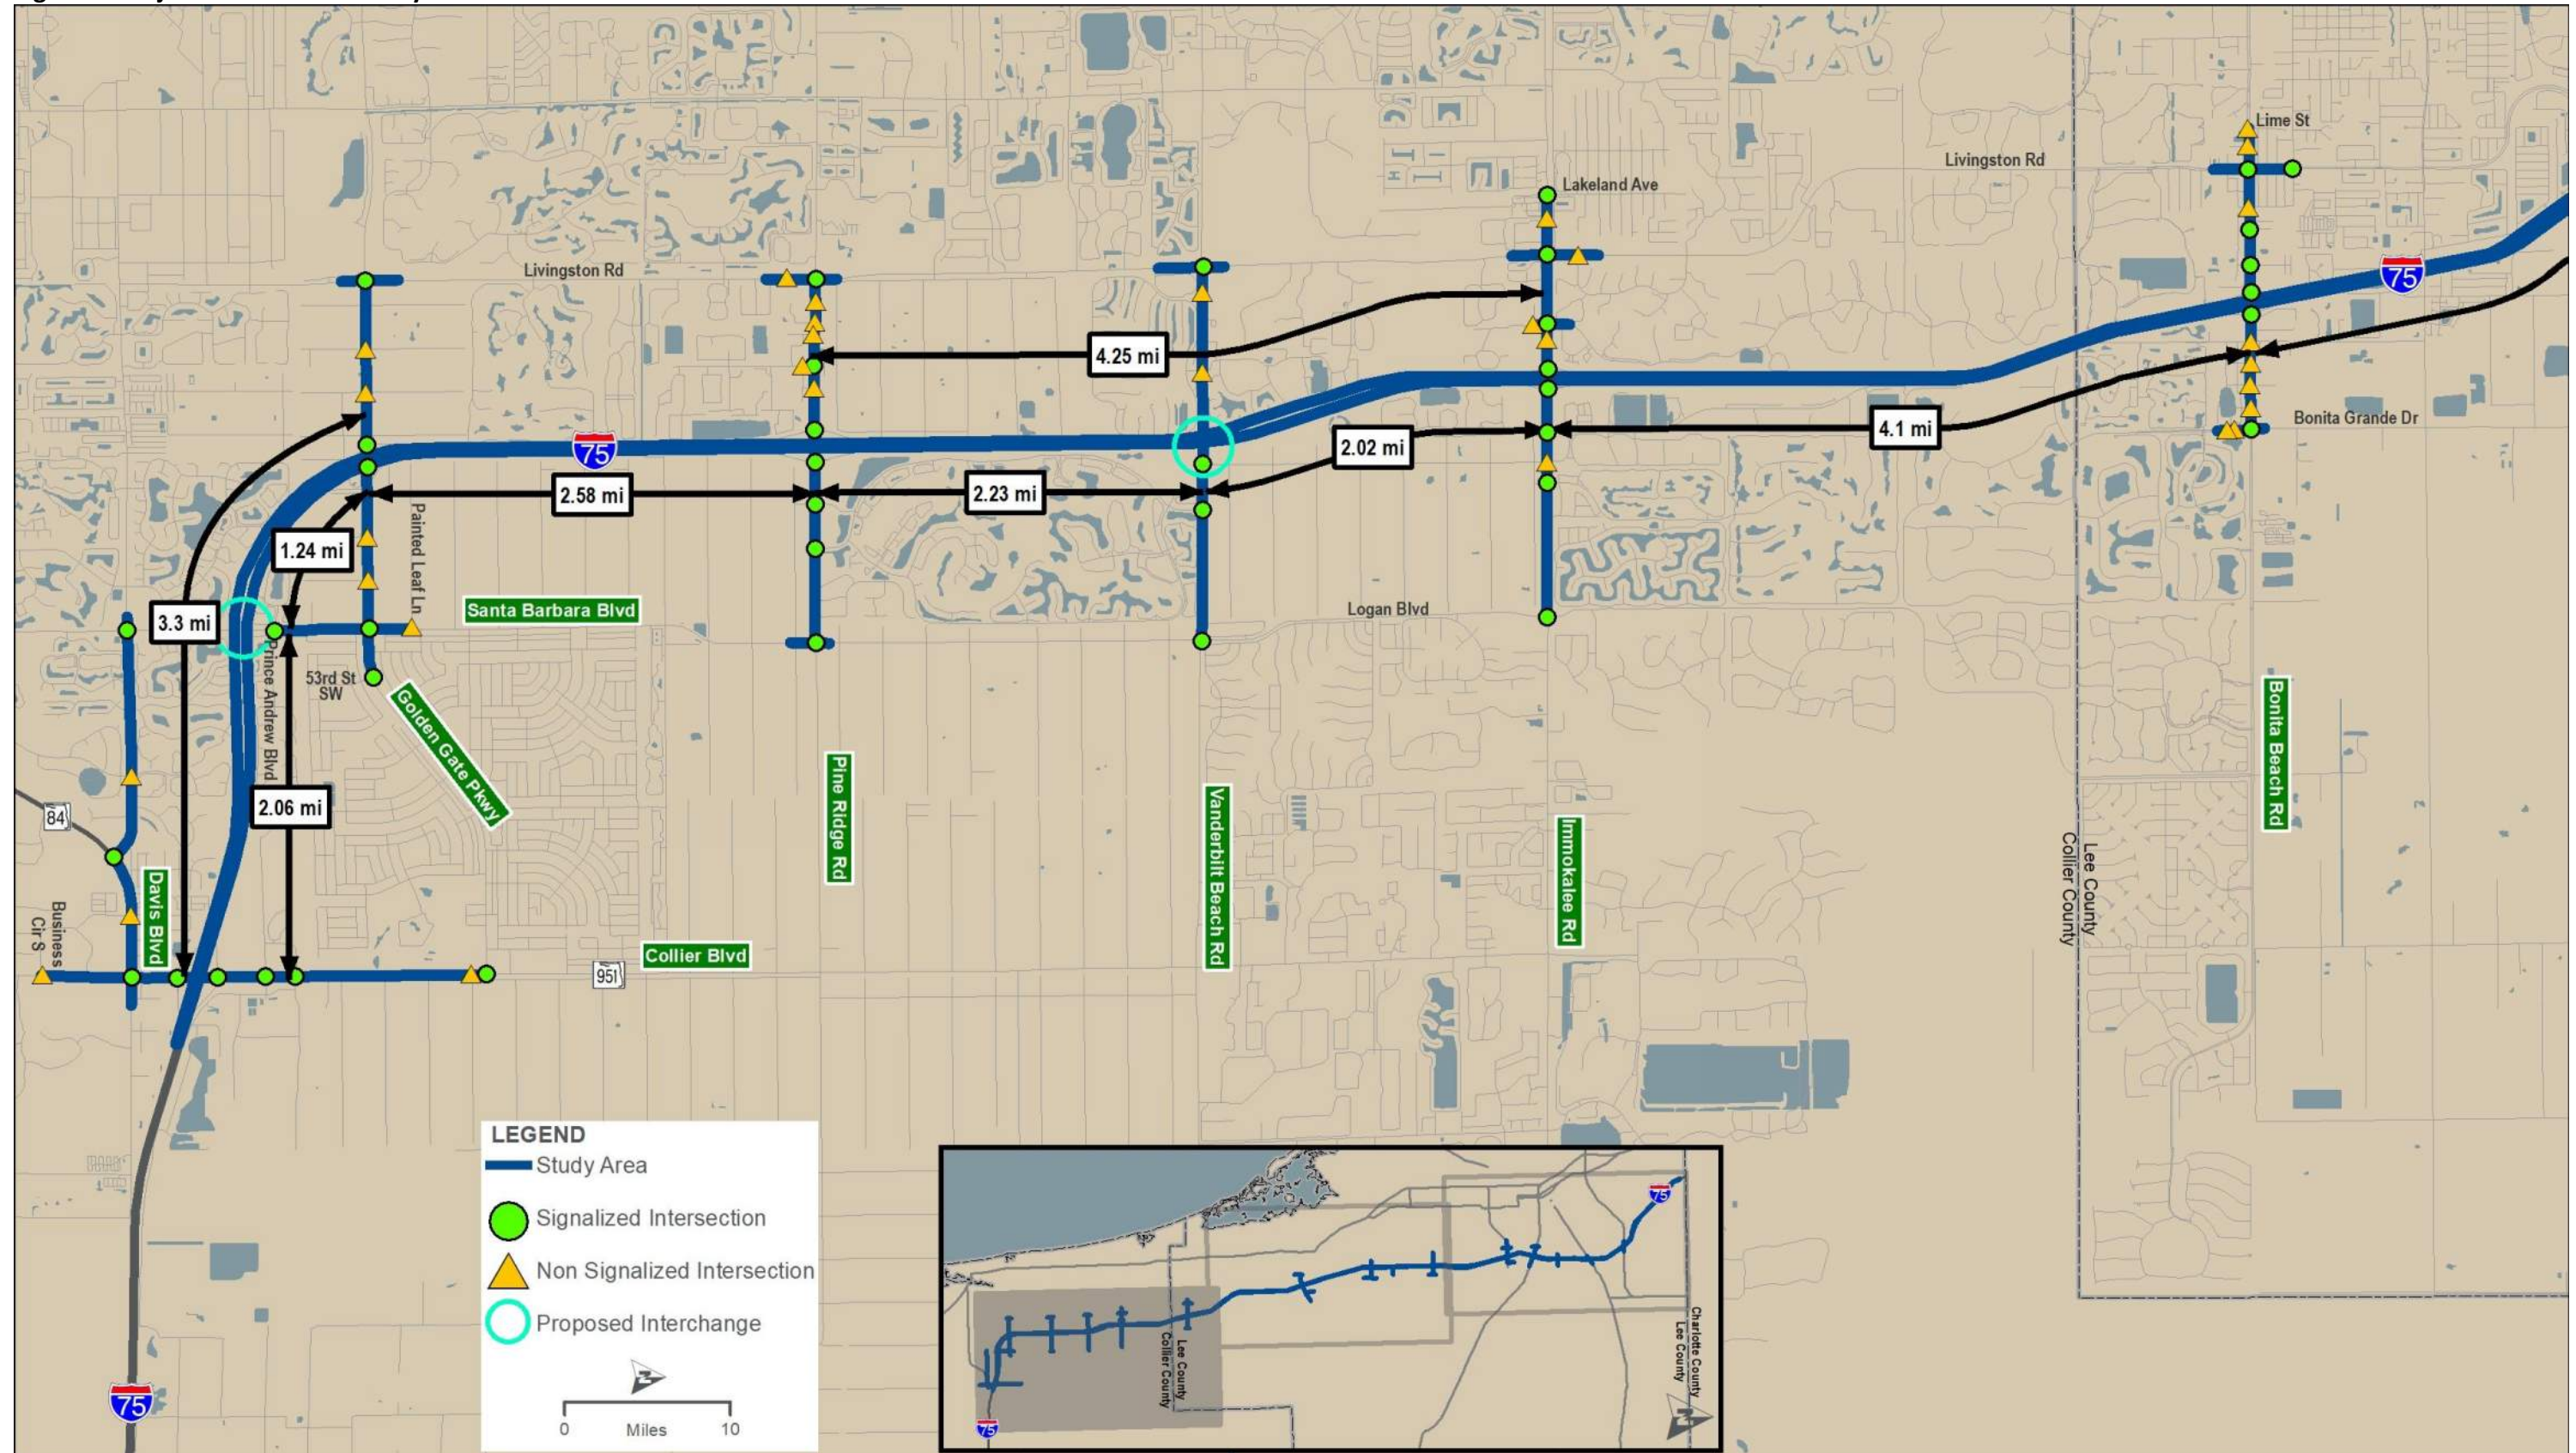

Figure 2. Project Location and Study Area

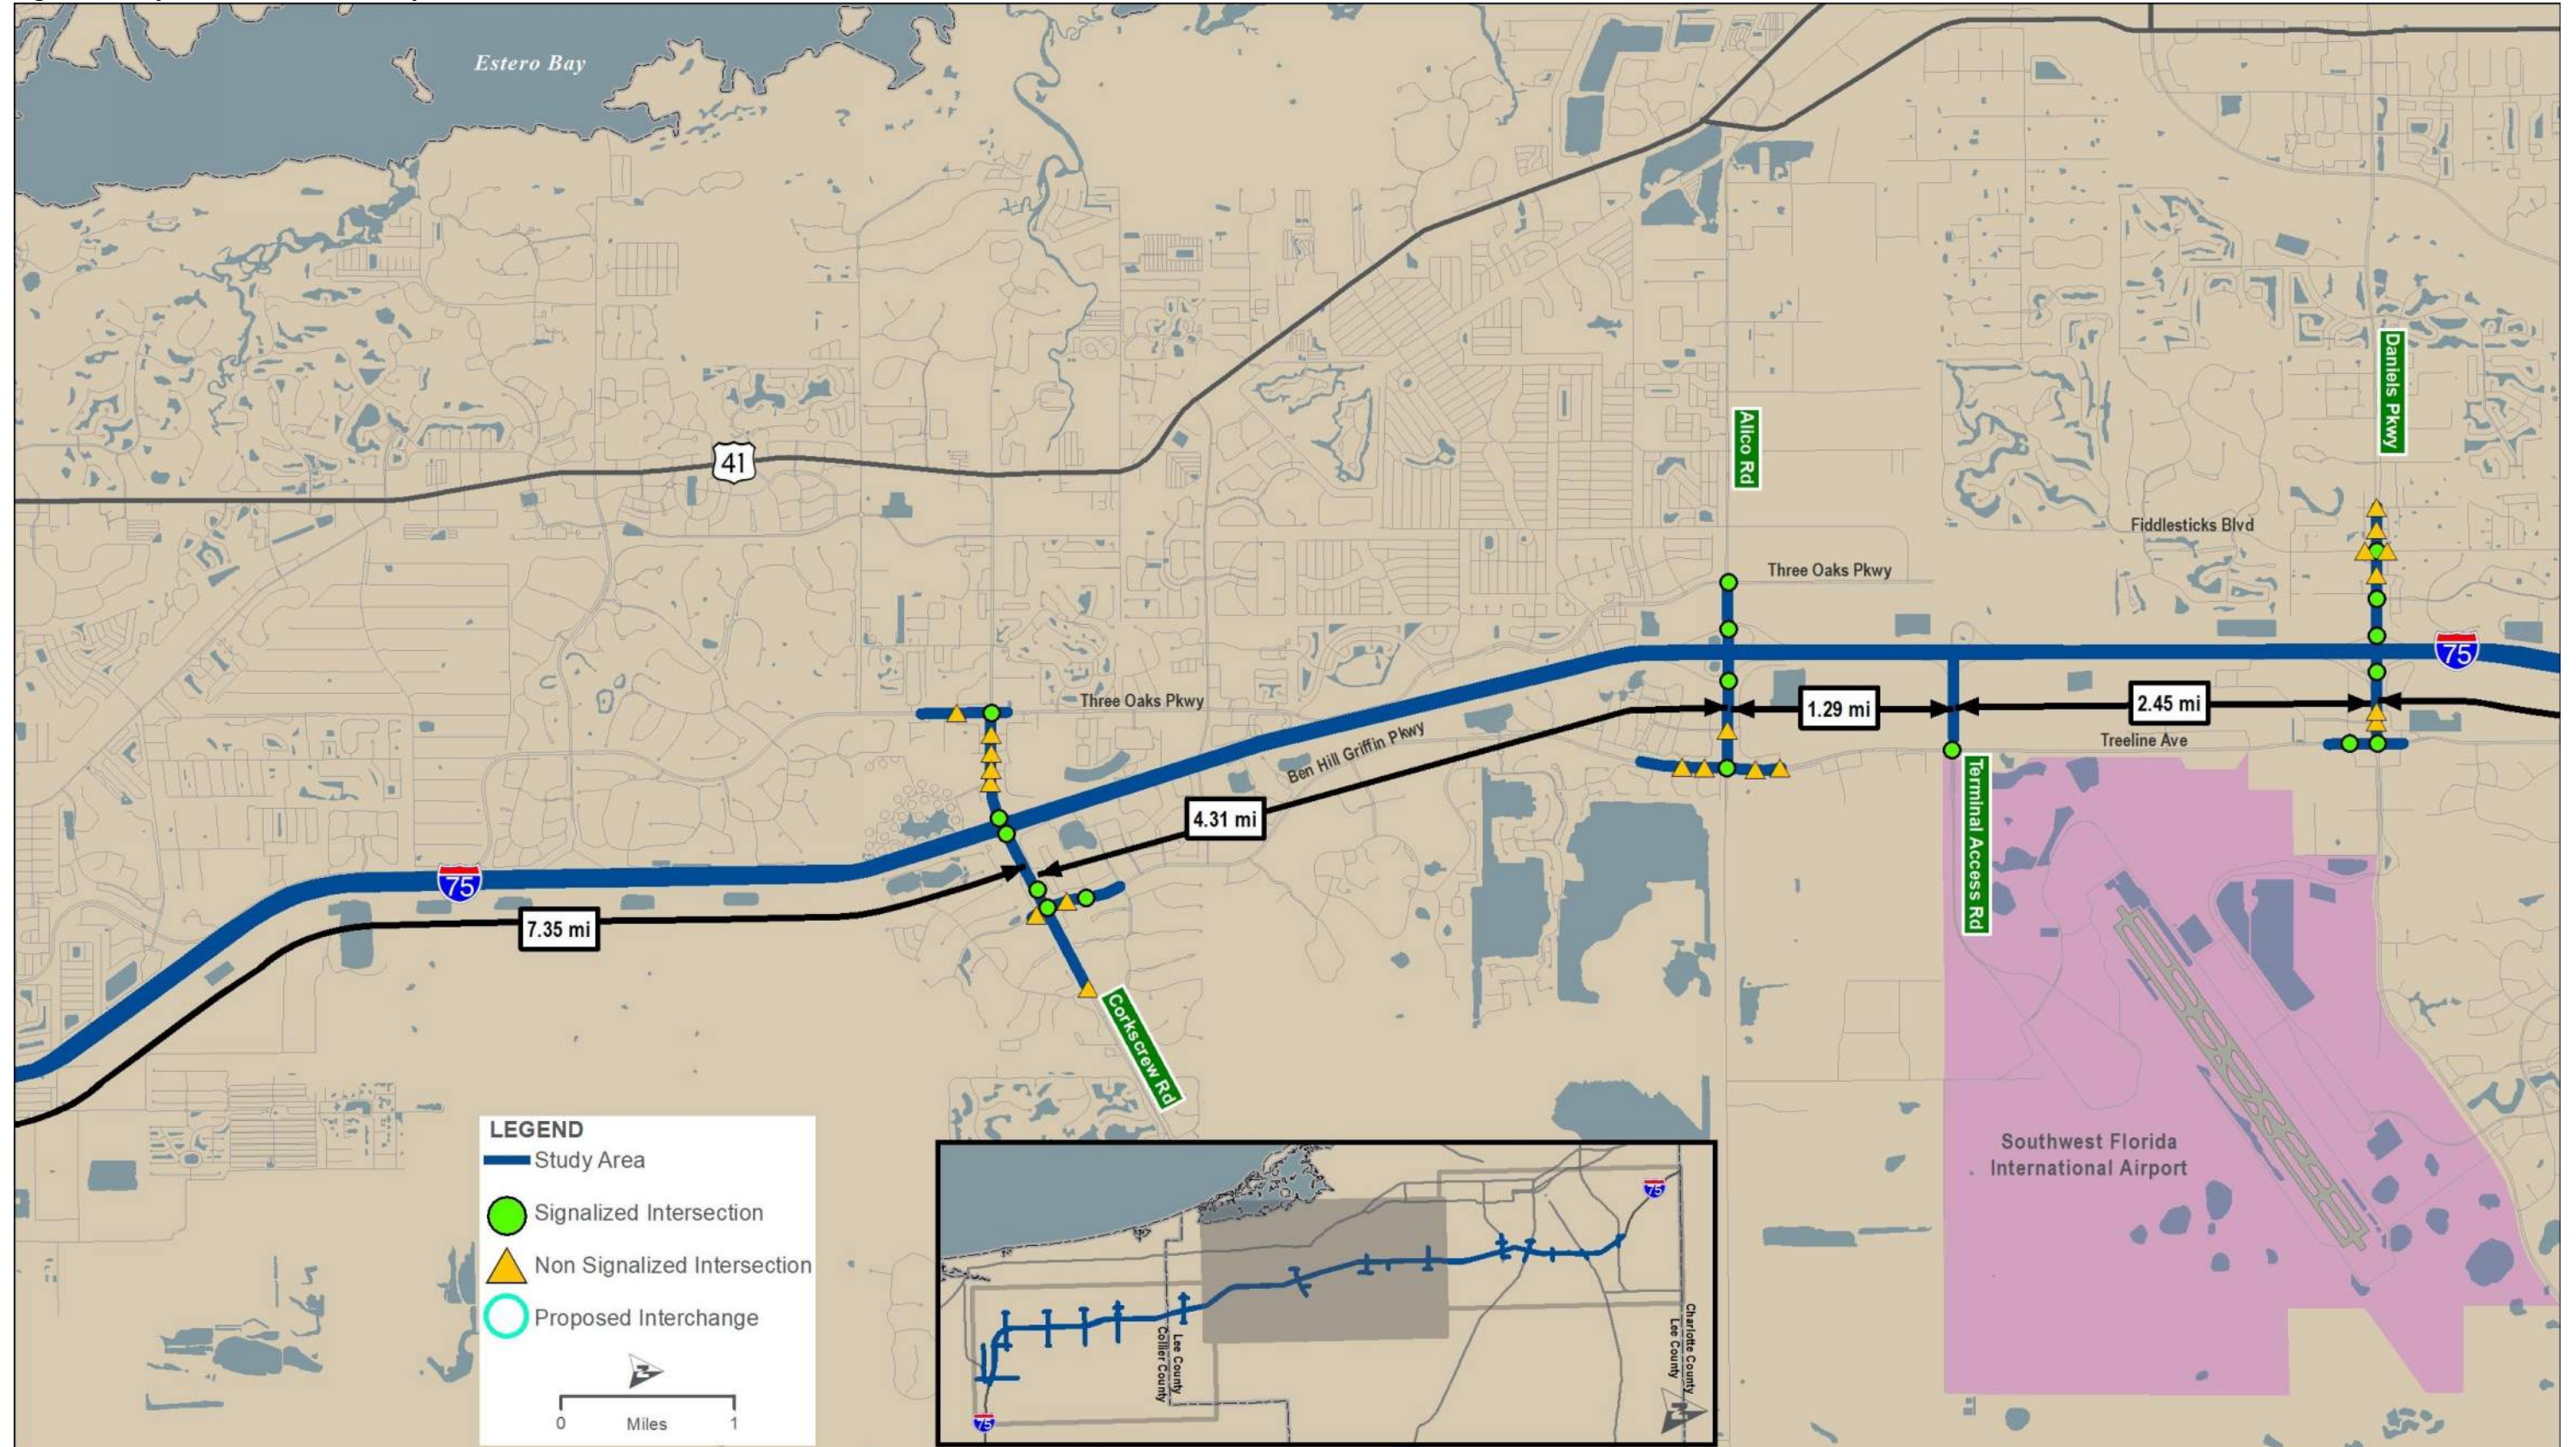

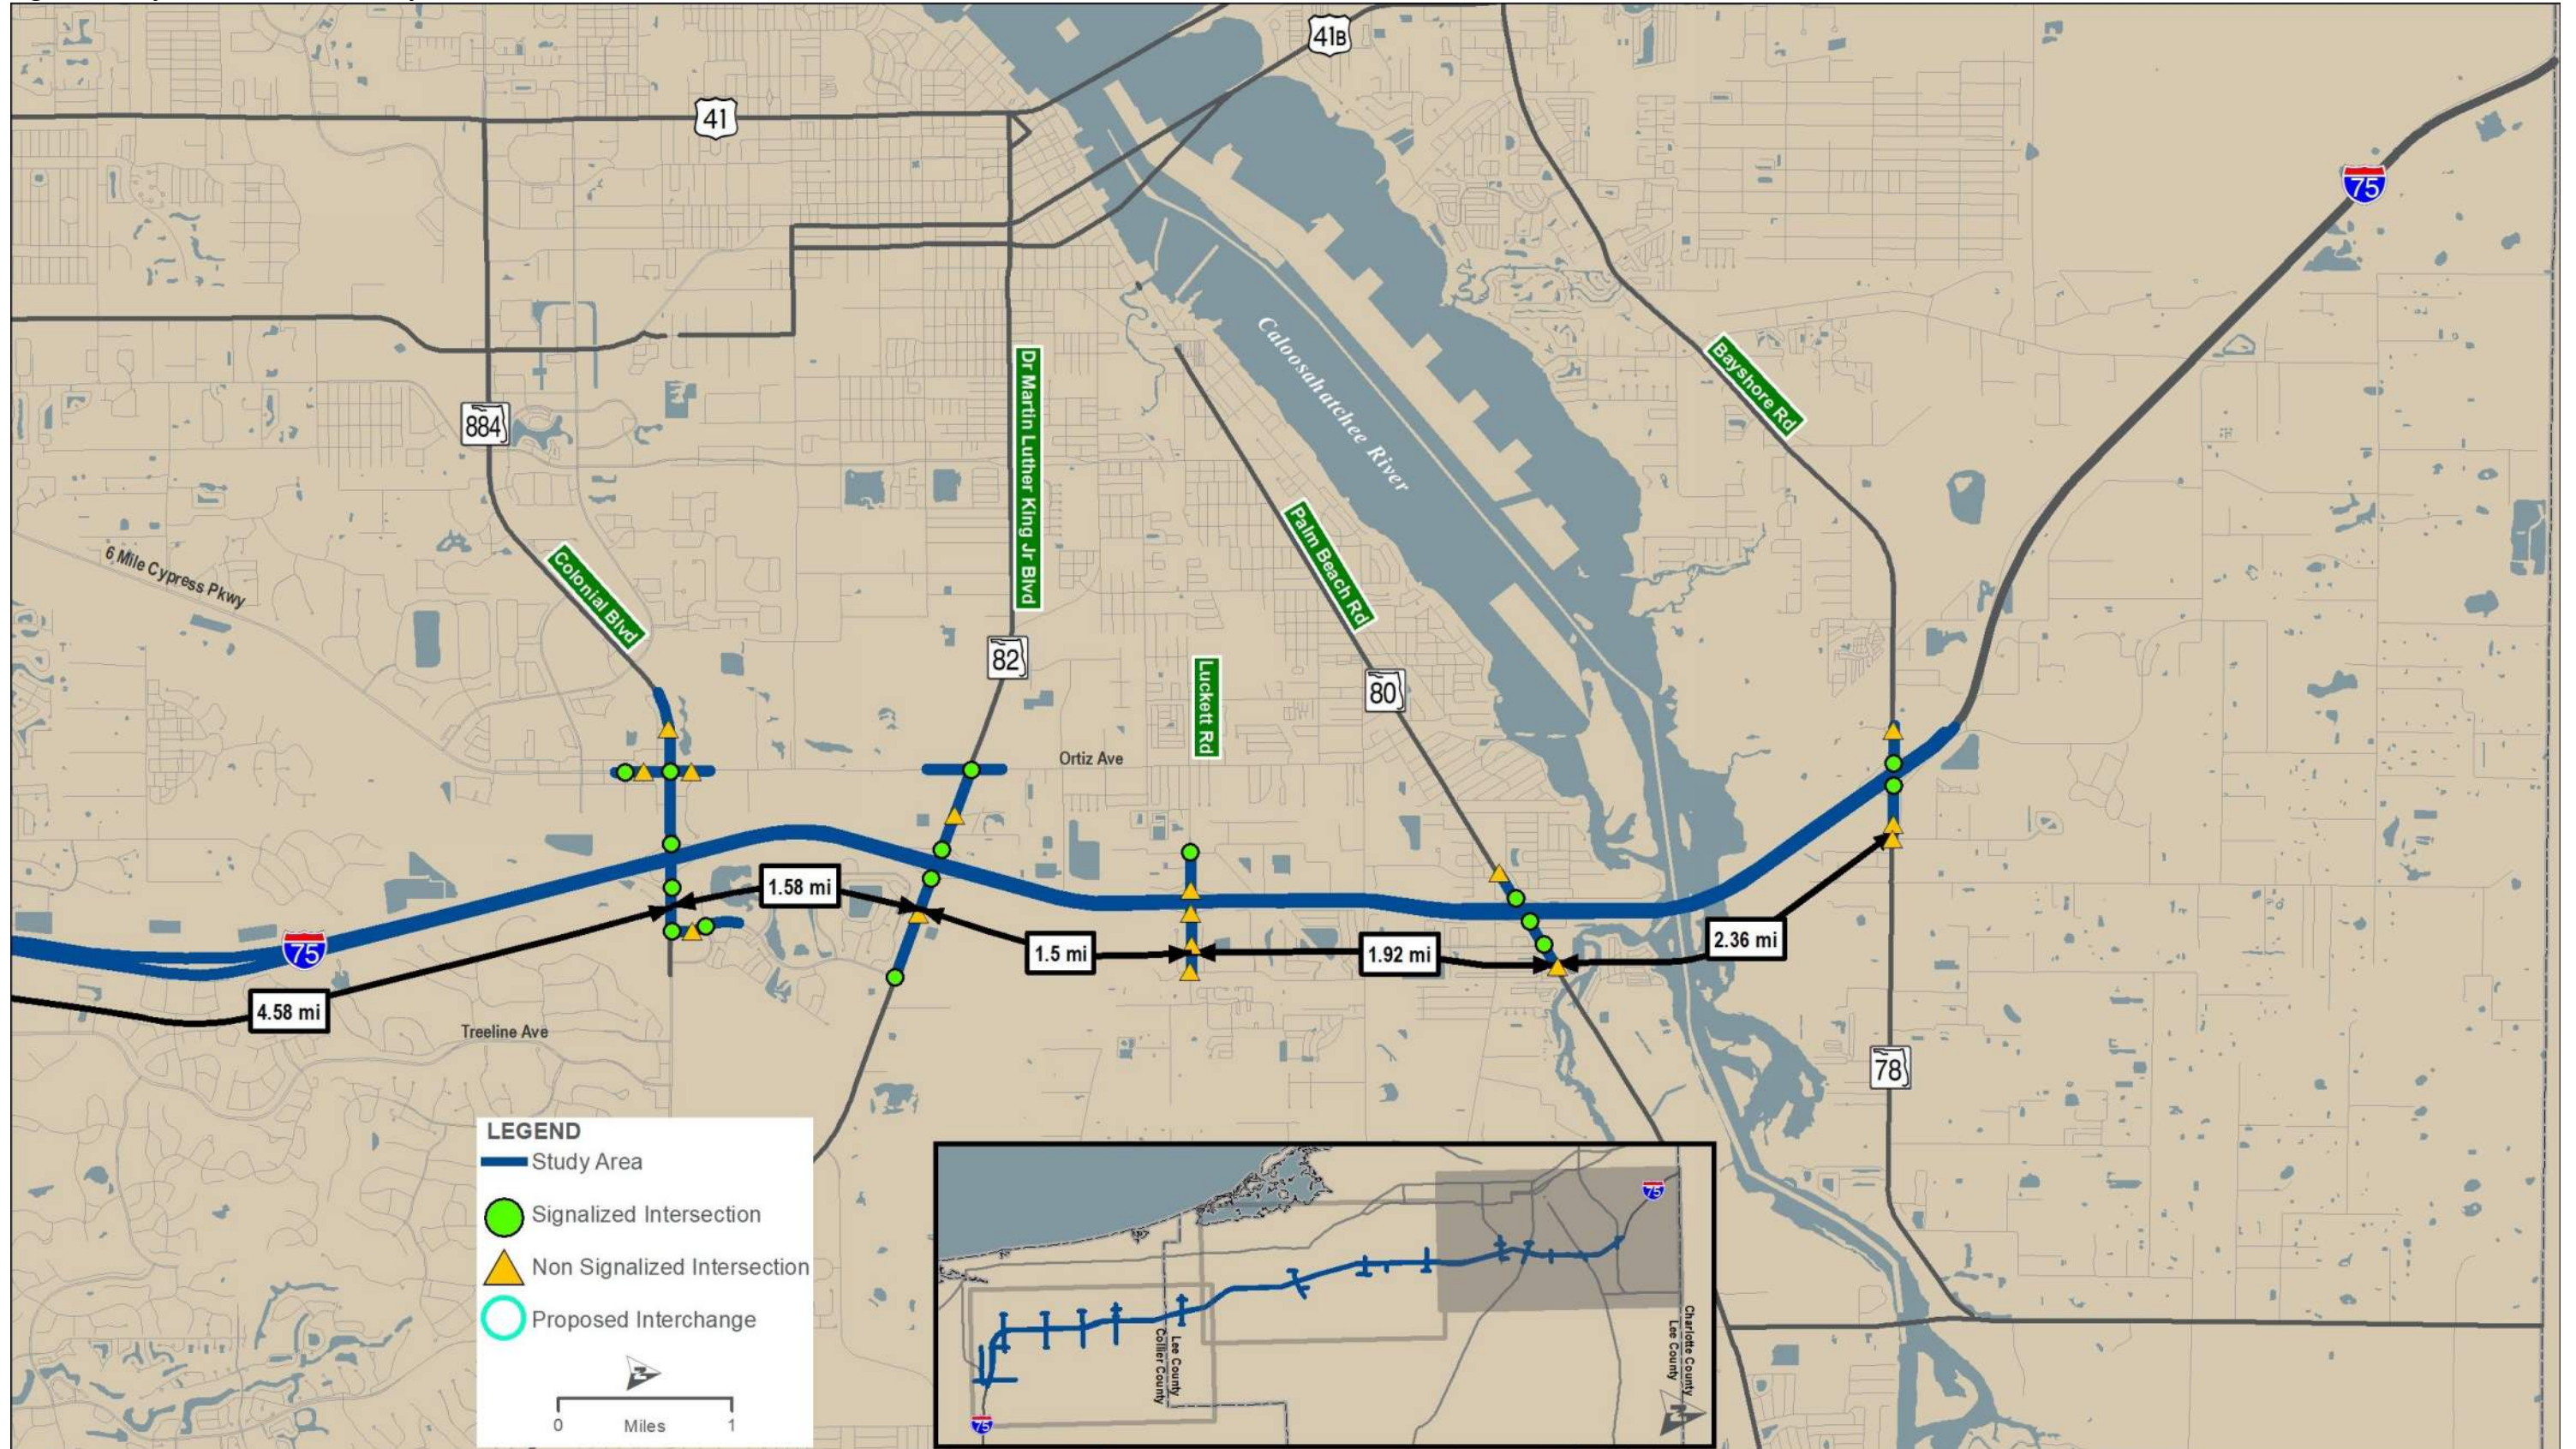

Figure 3. Project Location and Study Area

## 5. Project Schedule

Submittal of Final Design Concept Plans is tentatively scheduled for October 2022. The public hearing is tentatively scheduled for January 2023.

Funding for the PD&E study is in the currently adopted Five-Year Work Program as listed below:

- 442519-2: I-75 (SR 93) from east of SR 951 (Collier Boulevard) to Collier/Lee County Line, PD&E/EMO Study, FY 2019/2020
- 442519-3: I-75 (SR 93) from Collier/Lee County Line to SR 78 (Bayshore Road), PD&E/EMO Study, FY 2019/2020
- Strategic Intermodal System (SIS) Long Range Cost Feasible Plan FY 2029-2045 has identified funds for subsequent phases including PE and ROW

## 6. Analysis Scenarios

Analysis will be conducted for the following scenarios to identify appropriate IAR actions for interchanges within the project limits:

- Existing (2019)
- No-Build (2025 and 2045)
- Ultimate Build (2025 and 2045)

The analysis scenarios are described as follows:

- The Existing scenario represents the existing condition as it was during the count program and will be used for developing and calibrating a baseline scenario.
- The No-Build scenario is the existing configuration plus any planned improvements unrelated to this PD&E. This includes planned improvements with construction phases identified in cost feasible plans and due to be in place by the most recently adopted county LRTP horizon years for the travel demand model being used. The No-Build scenario will include all horizon year improvements regardless of the analysis year.
- The Ultimate Build scenario will, by definition, meet the needs of design year traffic in the ultimate configuration when all of the implementation phases have been completed.

A Traffic Technical Memo (Non-IAR) will be developed to document the segmentation process and supporting analysis for the phased implementation of improvements.

## 7. Alternatives

The following alternatives will be considered during the preliminary analysis phase of the project using the Design Year traffic forecasts for I-75 and interchanges within the project limits.

- No-Build Alternative: The No-Build (no action) Alternative will include currently planned and programmed improvements or projects currently under design.
- Ultimate Design Alternative: The Ultimate Design Alternative will include all recommended mainline and interchange improvements within the PD&E study area. Transportation System Management and Operations (TSM&O) improvements, including ramp metering and signal upgrades, will also be evaluated as part of the Ultimate Design Alternative in coordination with FDOT District One.

Subsequent to determining the ultimate design, the following tasks will be performed:

- Identify the order in which the existing conditions will fail.
- Segment the ultimate design into standalone projects that can be implemented while fitting into the ultimate framework with limited throwaway, and that have the ability to be operable on their own from a phased implementation scenario.

The Ultimate Design Alternative will evaluate managed lanes and determine the location of ingress/egress points and direct connect ramps for the entire I-75 corridor. The ingress/egress points for the ultimate design will impact how the corridor is segmented. The segmentation plan will also include an evaluation of the full I-75 corridor, which is required for the managed lanes module to be effective, but the managed lanes and ingress/egress points may only cover a certain segment of I-75.

## 8. Data Collection

### Transportation System Data

Available existing traffic data for the I-75 mainline and ramps will be obtained from FDOT District One. All other traffic data will be determined using the procedures described below. Sources of information to be collected shall include, but not be limited to:

- Straight Line Diagrams (SLDs);
- Roadway Characteristic Inventory (RCI) Data;
- Florida Geographic Data Library (FGDL) Geographic Information System (GIS) Data;
- FDOT Standard Indexes;
- FDOT Traffic Information.

### Existing and Historical Traffic Data

Data collection for the study shall consist of information from various sources. It shall be comprised of existing information and field collected data. Sources of information to be collected shall include, but not be limited to:

- Latest Five-Year Crash History;
- StreetLight Insight Origin-Destination (OD) Data – to be obtained from the FDOT District One Interstate Program Manager (IPM) and used to validate the OD matrices developed for the Vissim simulation;
- Traffic Count Information; and
- District One Regional Planning Model (D1RPM) 2015 and 2040 Cost Feasible Model

### Traffic Counts:

In accordance with the Manual on Uniform Traffic Studies (MUTS) and the Project Traffic Forecasting Handbook, field traffic count data will be collected at the 14 existing interchanges and sites of the two proposed interchanges as shown in **Attachment A**. The traffic counts will include 3-day classification counts, 3-day bi-directional volume counts, and typical weekday AM and PM peak period (7-9 AM and 4-6 PM) turning movement counts. The intersection traffic counts will include pedestrian, bicyclist, and truck volumes. A peak hour volume summary will be provided by approach.

In addition to the ramp terminal and adjacent intersections, several local intersections are being included in the analysis as their traffic flow may change due to the proposed improvements. These intersections are on the local network stemming off the study arterials and are not expected to have an impact on the freeway or interchange operations. They will be included in the simulation models to generate platooning and to verify that they do not cause queue spill back into the study arterial intersections. Additional traffic counts may be needed at other locations depending on the alternative configuration being analyzed.

#### Crash Data:

Crash data will be collected from the FDOT Crash Analysis Reporting System (CARS) along mainline I-75 and state facilities and supplemented with the University of Florida's Signal Four Analytics. The data collected will include the number, type and location of crashes, number of fatalities and injuries, and estimates of property damage and economic loss. Crash data will be obtained for the I-75 mainline from east of Collier Boulevard to north of Bayshore Road and for each of the primary cross streets identified in **Attachment A**.

#### Field Data:

Additional field data will be collected for microsimulation calibration purposes including I-75 mainline peak period speeds from the Regional Integrated Transportation Information System (RITIS) and arterial travel times using Bluetooth stations. Field visits will also be conducted to collect information on existing driver behavior and congestion levels, and to verify signal phasing information such as protected/permitted left-turn operations, right-turn-on-red restrictions, phasing, etc. Existing signal plans and timing information for signalized intersections will be gathered from Lee County and Collier County.

#### **Land Use Data**

Existing and future land use data within the area of influence will be obtained from the adopted Lee County and Collier County Comprehensive Plans.

#### **Environmental Data**

Environmental data and impacts will be investigated in the ongoing PD&E study. All available environmental data from ETDM and other studies will be considered during the environmental analysis of alternatives. The FDOT's Area of Interest (AOI) Tool in the Efficient Transportation Decision Making (ETDM) process will be utilized to establish a project buffer that identifies pertinent environmental features within a 300-foot swath of land measured from the existing right-of-way. The preliminary environmental impacts of implementing the proposed Build Alternative improvements shall be documented in any IAR resulting from the Traffic Technical Memorandum developed for this study. The following environmental reports will be prepared, as documented in the ETDM Screening Report, as part of the PD&E Study:

- Environmental Document (Type II Categorical Exclusion);
- Noise Study Report;
- Sociocultural Effects Evaluation (SCE);
- Air Quality Technical Memorandum;

- Level I Contamination Assessment Report (Contamination Screening Evaluation Report);
- Conceptual Stage Relocation Plan;
- Water Quality Impact Evaluation;
- Natural Resource Evaluation (Wetlands, Species and EFH);
- Conservation Measures and Mitigation Plan;
- Cultural Resource Assessment Survey Addendum;
- Section 4(f) Determination of Applicability (DOA);
- Wild and Scenic Rivers, Navigable Waterways, and Coastal Zone Management Assessment

### **Planned and Programmed Projects**

This project will consider all programmed and planned roadway improvements in the area. Planned and programmed projects will be consistent with adopted Cost Feasible Plan and FDOT Work program. The project team will coordinate with project stakeholders including FDOT, Lee County, Collier County, and Lee-Collier TPO within the project study area and will obtain concurrence with FDOT District One prior to incorporating them in the study. These capacity improvements will be consistent with those specified in the regional transportation plans including the following:

- FDOT 5-Year Adopted Work Program;
- FDOT SIS plans;
- FDOT State Transportation Improvement Program (STIP);
- Committed improvements from local and private sources;
- Lee County Metropolitan Planning Organization (MPO) Long Range Transportation Plan (LRTP);
- Collier County MPO LRTP;
- I-75 at Pine Ridge PD&E Study;
- I-75 at SR 951 studies and design plans;
- I-75 at Colonial Boulevard studies and design plans;
- Developments of Regional Impact (DRIs) within the area;
- PD&E studies and master plans within the area; and
- Unified Planning Work Program (UPWP) (if applicable).

These projects will be documented in the Traffic Technical Memo and IAR documents.

## **9. Travel Demand Forecasting**

A specially validated version of the District One Regional Planning Model (D1RPM) with an enhanced 2015 base year and 2040 horizon year will be used to develop traffic forecasts for the Lee and Collier County I-75 PD&E Study. This model version was created in support of the FDOT managed lanes efforts focused along I-75 and was prepared by and provided by the IPM team. Linear extrapolation will be leveraged to forecast the developed 2040 horizon year model to the 2045 design year for the project.

All volume development and traffic forecasts for the project will be documented in a Project Traffic Development Memorandum. With the proposed segmentation plan, volumes will be developed for the AM and PM peak periods for the following scenarios:

- Existing (2019)
- No-Build (2025 and 2045)
- Ultimate Build (2025 and 2045)

## 10. Traffic Operational Tools and Analysis

Interchange design configurations will range from standard to complex geometry involving managed lanes and CD systems. Therefore, traffic operational analysis will be performed for both the AM and PM peak periods using PTV's Vissim microsimulation software. The operational analysis will utilize the most recent version of Vissim<sup>1</sup> to calibrate existing conditions. Once calibration has been completed, any major Vissim software updates will be tested to determine if the models can be updated to the latest version without requiring significant re-calibration efforts. Given the duration of the project, using the most up-to-date version of the software that does not affect the analysis results is preferred and any changes will be documented in subsequent IARs.

### Calibration Methodology

Vissim models using 15-minute flow rates will be developed for a 3-hour AM and PM peak period and calibrated to existing conditions. The two shoulder hours outside the peak hour will account for traffic buildup and dissipation characteristics within the AOI. The 2019 update of FHWA's Traffic Analysis Toolbox Volume III: Guidelines for Applying Traffic Microsimulation Modeling Software and 2014 FDOT Traffic Analysis Handbook will be used as a guideline for the development of the project Vissim models.

Existing Conditions Vissim Model Development:

- Subarea Vissim models will be developed for each interchange area. A 30-minute seeding period will be used for the arterial inputs. Once the model is developed and error-checking has been performed, the subarea models will be calibrated to accurately replicate the traffic performance for the existing conditions for the interchange. The arterial models will be calibrated to Bluetooth travel time data and supplemented with site observations.
- A Vissim model for the I-75 mainline and ramps will be developed for existing conditions. The I-75 mainline model will utilize a 60-minute seeding period and will be calibrated using speed data from RITIS. Observed queue spillback onto the mainline from the ramp terminals will require the addition of the ramp terminal signal in order to calibrate the mainline subarea, otherwise the ramp terminal intersections will not be included in the I-75 mainline model.
- Subarea Vissim models will be merged into one single model by combining the interchange models with the I-75 mainline model. A 60-minute seeding period will be applied for the entire model. Once the model is developed and error-checking has

---

<sup>1</sup> As of June 9, 2020, the most recent version is Vissim 2020.

been performed, adjustments may be required at the locations where the models are tied together to ensure that the models accurately replicate the traffic performance for the existing conditions.

- Existing Vissim models will be validated to the 2019 existing year traffic counts and OD patterns.
- The calibration of the existing AM and PM peak period models will target the thresholds indicated in the FDOT Traffic Analysis Handbook Table 7-7 Classical Model Calibration Targets shown in **Table 1**.

**Table 1:** Vissim Calibration Targets<sup>1</sup>

Calibration Criteria	Calibration Target/Goal
Traffic Volume	Simulated and measured link volumes for more than 85% of links to be: <ul style="list-style-type: none"> <li>• Within 100 vph for volumes less than 700 vph</li> <li>• Within 15% for volumes between 700 vph and 2700 vph</li> <li>• Within 400 vph, for volumes greater than 2700 vph.</li> </ul>
	Simulated and measured link volumes for more than 85% of links to have a GEH statistic value of five (5) or lower.
	Sum of link volumes within calibration area to be within 5%.
	Sum of link volumes to have a GEH statistic value of 5 or lower.
Speed	Modeled average speeds on I-75 to be within +/- 10 mph of field-measured speeds on at least 85% of all RITIS detector locations.
Travel Time	Modeled arterial travel times within 15% (or 1 min, if higher) for more than 85% of segments.
Visualization	Check consistency with field conditions of the following: on- and off-ramp queuing; weaving maneuvers; patterns and extent of queue at intersections and congested links; lane utilization/choice; location of bottlenecks; etc.
	Verify no unrealistic U-turns or vehicles exiting and reentering the network.

<sup>1</sup>source: FDOT Traffic Analysis Handbook, Table 7-7 Classical Model Calibration Targets.

**Future Conditions Vissim Model Development:**

- The design year simulation models will utilize the adjusted parameters used to calibrate the existing conditions models.

**Selection of Measures of Effectiveness (MOE)**

Site-specific MOEs used to evaluate and compare the alternatives will be as follows:

- Signalized/unsignalized Intersections – Volume, control delay, maximum queue lengths;
- Arterial Segments – Volume, travel speed, travel time, maximum queue lengths.
- Freeway Segments – Volume, density, travel speed, congestion charts; and
- Off Ramps – Volume, maximum queue lengths.

Split intersections or other concepts that require multiple signals or adverse travel will include travel time by movement to and from consistent locations. Consistent with the 2014 FDOT Traffic Analysis Handbook Section 8.4.3, level-of-service (LOS) computed from microsimulation analysis will be reported as an “estimated LOS”. Freeway segments and ramp merges, diverges, and weaves will be evaluated using Vissim and compared to HCM thresholds for determining estimated LOS. Intersection and arterial operations will also be evaluated using Vissim and compared to HCM metrics.

In addition to the site-specific MOEs mentioned above, network-wide MOEs will also be evaluated and are described below:

- Total Travel Time;
- Total Delay Time;
- Vehicles Arrived;
- Average Delay Time;
- Latent Delay Time;
- Latent Vehicles; and
- Total Delay plus Latent Delay.

### **Capacity Analysis Tools**

Capacity analysis tools, including HCS and Synchro, may be used for a high-level screening of alternatives during the concept development process. HCS and Synchro tools and results will not be included in the IAR documentation.

## **11. Safety Analysis**

Historical crash data within the study area will be obtained from the FDOT Crash Analysis Reporting System (CARS) database for the most recent five-year period available (2013-2017). The CARS data will be obtained from the FDOT Safety Office for the mainline, interchanges, and major cross streets within the area of influence and will be supplemented with information gathered from the Signal Four Analytics tool. The data collected will include crash number, type, location, and severity. Utilizing the information obtained from the crash data, an evaluation of existing conditions will be performed early in the study process to aid in the development of the ultimate design. A summary of existing crash history will be included in the Traffic Technical Memo.

An objective and quantitative evaluation of the proposed improvements on traffic safety along the corridor will be performed by utilizing FHWA's Crash Modification Factor (CMF) Clearinghouse and applying the Highway Safety Manual (HSM) predictive method process, where appropriate. Any crash prediction will be conducted utilizing the methodologies and guidance provided by the HSM and associated supplemental documentation. A detailed accounting of this methodology will be provided for Department review and approval prior to application.

## **12. Consistency with Other Plans/Projects**

The I-75 PD&E will maintain consistency with the Lee County MPO LRTP, Collier County MPO LRTP, I-75 at Pine Ridge Study, I-75 at SR 951, I-75 at Corkscrew Road improvements, and the I-75 at Colonial Boulevard Plan. Any planned improvements unrelated to this PD&E with construction phases identified in cost feasible plans and due to be in place by the most recently adopted county LRTP horizon years for the travel demand model being used will be incorporated into the future No-Build and Build scenarios developed as part of this study. The IPM will include these improvements in the travel demand model that is being provided. If proposed improvements are inconsistent with any plan, steps to bring the plan into consistency will be developed.

### **13. Environmental Considerations**

A Type II Categorical Exclusion (CE2) is being prepared and key environmental findings from the CE2 will be added to each IAR. Permit requirements will be coordinated with the following agencies as part of the ETDM and NEPA process: U.S. Army Corps of Engineers, U.S. Fish and Wildlife Service, South Florida Water Management District, Florida Department of Environmental Protection, and Florida Fish and Wildlife Conservation Commission.

Limited right-of-way is acquisition is anticipated to construct the proposed Ultimate Build Alternative improvements. No significant environmental impacts are anticipated. Information concerning the status of the Environmental Approval and the permitting process will be included in IARs.

### **14. Coordination**

An appropriate effort of coordination will be made with proposed developments in the area. A review of future network changes and land use growth will be performed as part of the travel demand model's subarea validation, which is an effort being undertaken by the IPM for this PD&E project. The IPM will summarize and distribute network and land use change information to stakeholders including FDOT, Lee County, and Collier County for concurrence. Based on stakeholders' inputs, and after approval from FDOT District One, the changes will be incorporated into the travel demand model. Coordination with the IPM will be made before proceeding with project-level traffic forecasts. Project level traffic forecasts (AM and PM peak hours) will be developed by the PD&E project team using the travel demand model that is provided by the IPM as the base. All future year Vissim models will include all cost feasible improvements that exist within the project limits. The IPM will provide a list of the network and land use changes to the project team as part of the travel demand modeling documentation for inclusion in the Traffic Technical Memo and IAR documents. This coordination will occur before the development of traffic forecasts.

### **15. Anticipated Design Exceptions and Variations**

If an exception/variation should arise for the Ultimate Build scenario, it will be processed per FHWA and FDOT standards.

### **16. Conceptual Signing Plan**

A conceptual signing plan will be developed for the Ultimate Build scenario. The conceptual signing plan will provide major guide sign placement and messages. The conceptual signing plan will be prepared in accordance with all applicable FDOT, FHWA, and MUTCD guidelines.

### **17. Access Management Plan**

The improvement may affect access management within the study area. An access management plan will be developed for the Ultimate Build scenario to complement the improvements to the interchanges.
