SANTA BARBARA BLVD  
AT  
PRINCE ANDREW BLVD/RECREATION LN

SHEET NO.  
T-1

## MaxTime Basic Default Timing Sheet

Controller Number	355
Controller Name	Vanderbilt @ Logan
Main St.	Vanderbilt Beach Rd.
Side St.	Logan Blvd
IP Address	10.129.44.180
NTCIP Receive Port	Automatic
NTCIP Send Port	161
NTCIP Timeout	1000

### Unit Parameters

Startup Flash	5
All Red Exit	0
MCE Seq.	1

Auto Ped Clr	Disable
Grn Flash Freq.	60
Primary Start	0

Red Revert	4
Yel Flash Freq.	60
Secondary Start	0

Backup Time	600
MCE Enable	Enable
Free Seq.	1

Ext M

lode	Enable

EXISTING CONDITIONS TRAFFIC TECHNICAL MEMORANDUM

Appendix F:  
Historical Crash Data

# Contributing Cause Descriptions

## Lighting Categorization

Lighting	Lighting Category
Dark - Lighted	Dark With Lights
Dark - Not Lighted	Dark - No Lights
Dark - Unknown	Other / Unknown
Day	Daylight
Other	Other / Unknown
Unknown	Other / Unknown

## Road Surface Condition Categorization

Road Surface Condition	Road Surface Condition Category
Dry	Dry
Other	Other / Unknown
Slick (Ice, Frost, Oil)	Wet / Slick / Unpaved
Standing Water	Standing Water
Unknown	Other / Unknown
Unpaved (Mud, Dirt, Gravel, Sand)	Wet / Slick / Unpaved
Wet	Wet / Slick / Unpaved

## Cost Per Crash Data

### FDOT Design Manual Table 122.6.2 FDOT KABCO Crash Costs

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$ 10,670,000
Severe Injury (A)	\$ 872,612
Moderate Injury (B)	\$ 174,018
Minor Injury (C)	\$ 106,215
Property Damage Only (O)	\$ 7,700

Adapted from FDOT Florida Design Manual 2020 Table 122.6.2

### FDOT Average Crash Costs by Facility Type

Statewide Average Cost Per Crash \$ 159,093

Facility Type	Urban Divided	Suburban Divided	Rural Divided	Urban Undivided	Suburban Undivided	Rural Undivided
2-3 Lanes	\$ 107,732	\$ 201,527	\$ 355,183	\$ 124,618	\$ 267,397	\$ 523,727
4-5 Lanes	\$ 123,406	\$ 225,315	\$ 473,637	\$ 112,896	\$ 190,276	N/A
6+ Lanes	\$ 123,598	\$ 166,258	\$ 451,492	\$ 41,650	N/A	N/A
Interstate	\$ 153,130	N/A	\$ 327,385	N/A	N/A	N/A
Turnpike	\$ 138,762	N/A	\$ 269,205	N/A	N/A	N/A

Adapted from FDOT Florida Design Manual 2020 Table 122.6.1

## Historical Crash Analysis

**I-75 SOUTH CORRIDOR MASTER PLAN**

---

EXISTING CONDITIONS TRAFFIC TECHNICAL MEMORANDUM

***DRAFT***

**SAFETY MEMORANDUM**

**Collier Boulevard at I-75**

**WPI Segment No.: 442519-2**

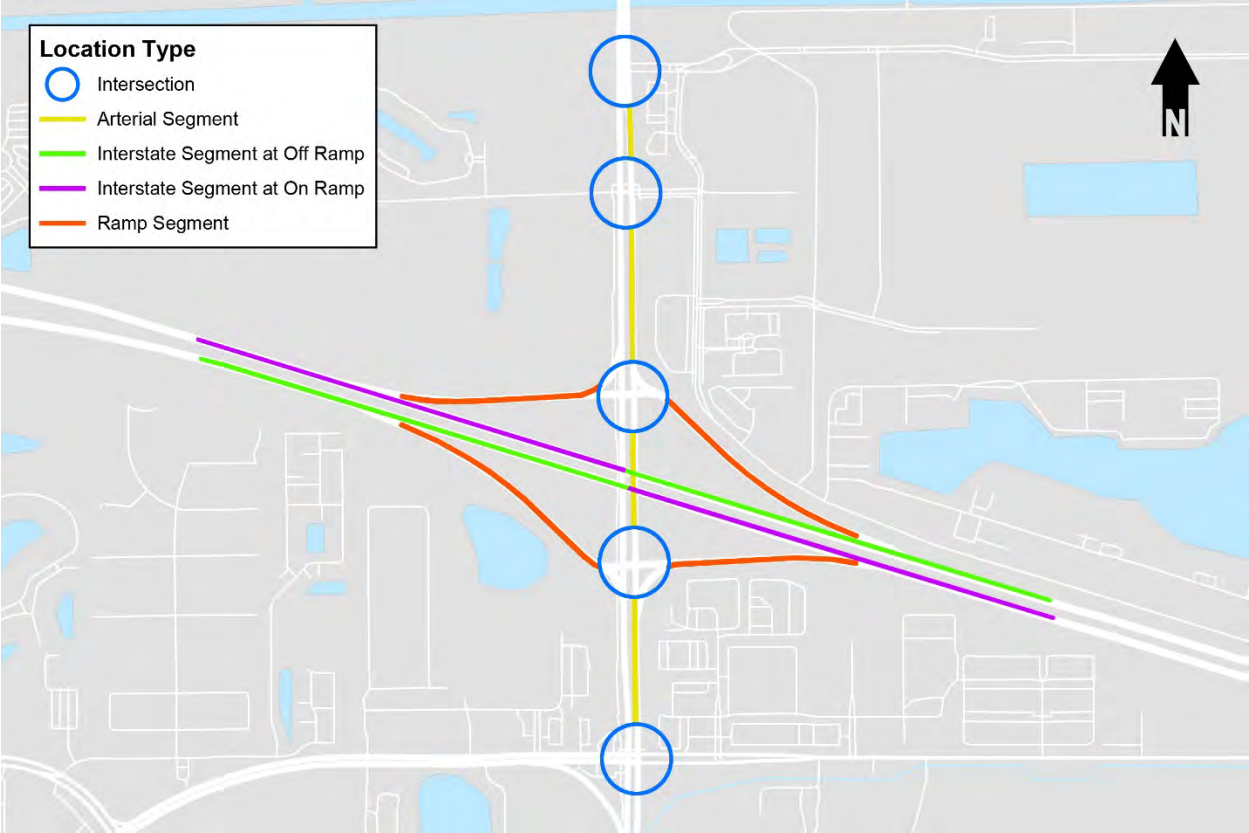

**Florida Department of Transportation**

**April 2021**

# 1.0 Historical Crash Data

The study area includes Collier Boulevard from Davis Boulevard / Beck Boulevard to City Gate Boulevard and I-75<sup>1</sup> from west of Collier Boulevard to east of Collier Boulevard, as well as the on- and off-ramps for the interchange. Crash data was obtained for the study area from FDOT's Crash Analysis Reporting (CAR) Online and the University of Florida's Signal Four (S4) crash database for the five-year analysis period from 2013 to 2017. **Figure 1** shows the division of the study area into intersection and segment locations. The intersection locations include a 250-foot influence area from the center of the intersection based on FDOT's spot location crash rate calculations, and the segments on the arterial include the roadway between intersections. On the interstate, the mainline segments have been divided into one segment per ramp gore point. The off-ramp segments begin 1,500 feet upstream of the off-ramp gore points and extend to the halfway point between the off-ramp and on-ramp gore points. The on-ramp segments extend from that halfway point to 1,500 feet downstream of the on-ramp gore points.

Figure 1: Study Area Locations

**Table 1** summarizes the number of crashes, vehicles, fatalities, and injuries that occurred during each of the analysis years. Roadways without any crashes are not included in this table. A total of 211 crashes involving 434 vehicles occurred during the analysis period resulting in zero fatalities and 135 injuries. This crash data is included in **Appendix F**. Most crashes occur on

<sup>1</sup> Although at this interchange I-75 is oriented east/west, the general direction of I-75 is still northbound/southbound. Throughout the report, the segments of I-75 that are oriented east will be referred to as southbound and the segments oriented west will be referred to as northbound.

Collier Boulevard intersections. Crash frequency trends vary year to year throughout the study area, and there is no clear trend of crash frequency increasing or decreasing.

## 2.0 Crash Analysis

### 2.1 Historical Crash Rates

The crash rate at each location was calculated using the Federal Highway Administration's (FHWA's) crash rate formula adapted for million vehicle miles traveled as follows<sup>2</sup>:

$$\text{Crash Rate} = \frac{1,000,000 * C}{365 * N * V * L}$$

Where

- C = Total number of crashes for the analysis period.
- N = Number of years in the analysis period.
- V = Average Annual Average Daily Traffic (AADT) per year on the roadway segment or entering the intersection during the analysis period.
- L = The length of the roadway segment when analyzing roadway segments, or 1 when analyzing intersections.

Each crash rate was then compared to the statewide average for that facility type using the procedure detailed in the FDOT CARS User Manual to determine the level of confidence that a location's crash rate is higher than the statewide average from the FDOT CARS database for 2013-2017 for a location's facility type (i.e., the high crash confidence). Locations that do not have statewide average crash rates associated with their facility type (e.g., ramp locations) have a statewide average crash rate and high crash confidence percentage listed as N/A.

**Table 2**, **Table 3**, and **Table 4** summarize the crash rates for the arterial segments, arterial intersections, and interstate segment locations respectively. A summary of the statewide average crash rates by facility type for facility types included in these tables can be seen in **Table 5**. The raw CAR output for five-year statewide average crash rates can be found in **Appendix D**. Only the northbound I-75 segment at the off-ramp to Collier Boulevard has a crash rate that is significantly higher than the statewide average, defined as a high crash confidence of 95 percent or higher. Additionally, the four ramp segments connecting the interstate to the arterial do not have a statewide average crash rate associated with their facility type. **Figure 2** shows a heat map of crashes for the study area. Crash clusters are present at Davis Boulevard, at and near the I-75 southbound ramp terminal, and at City Gate Drive.

---

<sup>2</sup> FHWA calculates crash rate in terms of 100 million vehicle-miles traveled. FDOT calculates crash rate in terms of million vehicle-miles traveled, so the constant is adjusted accordingly.

Table 2: Arterial Segment Crash Rates

Segment Location	Total Crashes	5-Year Average AADT	Segment Length (mi)	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*
Davis Blvd to I-75 SB Ramp Terminals	11	47,200	0.174	0.734	2.711	2.2	13.54%
I-75 SB to NB Ramp Terminals	8	47,200	0.131	0.709	2.711	1.6	13.08%
I-75 NB Ramp Terminals to City Gate Dr	1	47,200	0.184	0.063	1.730	0.2	0.23%
City Gate Dr to City Blvd N	0	33,400	0.072	0.000	4.714	0	0.00%

\* Segments with a High Crash Confidence greater than or equal to 95.00 percent are highlighted in red.

Table 3: Arterial Intersection Crash Rates

Intersection Location	Total Crashes	5-Year Average AADT	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*
Collier Blvd at Davis Blvd/Beck Blvd	82	56,600	0.794	0.749	16.4	50.00%
Collier Blvd at I-75 SB Ramps	31	59,500	0.285	0.343	6.2	41.55%

<b>Total</b>	<b>42</b>	<b>39</b>	<b>42</b>	<b>34</b>	<b>54</b>	<b>211</b>	42.2	<b>100.0%</b>

**Table 7**, **Table 8**, and **Table 9** summarize the most frequent crash type for arterial segments, arterial intersections, and interstate segments, respectively. If more than one crash type tied for the most common crash type, all the tied crash types were listed.

Rear end crashes were the most common on arterial segments and at intersections. The Highway Safety Manual (HSM) indicates that possible contributing factors for rear end crashes include inappropriate approach speeds, poor visibility of signals, unexpected lane changes on approach, narrow lanes, unexpected stops on approach, slippery pavement, and excessive speed.

Sideswipe crashes were the most common on interstate segments. While the HSM does not provide contributing causes specific to roadway segments for sideswipe crashes, some relevant contributing causes may include inappropriate approach speeds, unexpected lane changes on approach, narrow lanes, unexpected stops on the roadway, slippery pavement, and excessive speed.

**Figure 3** shows a map of crash locations by crash type. Any head-on, bicycle, and pedestrian crashes have been depicted with a star to emphasize crashes that are generally serious in nature. Crash types without any associated crashes are not listed in the legend.

Table 7: Arterial Segment Crash Types

Location	Most Common Crash Type	Total of Crash Type	% of Location Total
Davis Blvd to I-75 SB Ramp Terminals	Rear End	9	81.8%

## 2.3 Lighting and Road Surface Conditions

**Table 10** summarizes the lighting, weather, and roadway surface conditions that were present at the time of the crashes. A review of this table indicators that a majority of the crashes occurred during daylight (76.8 percent), clear or cloudy weather (91.5 percent) and on dry roads (86.7 percent).

Table 10: Crash Conditions Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage

<b>Total</b>	<b>42</b>	<b>39</b>	<b>42</b>	<b>34</b>	<b>54</b>	<b>211</b>	<b>42.2</b>	<b>100.0%</b>

**Table 11** summarizes wet/slick/unpaved and standing water road surface conditions as well as crashes taking place in dark conditions with no lighting by location for all locations with at least 30 crashes. Of these locations, Collier Boulevard at Davis Boulevard/Beck Boulevard has both the highest proportion of wet/slick/unpaved and standing water crashes (13 percent) and the highest proportion of crashes taking place in dark conditions with no lighting (1 percent). The method of consolidating road surface conditions and lighting conditions into the classifications shown in **Table 11** is included in **Appendix F**.

Table 11: Crash Cause Summary

Locations	Total Crashes	Wet / Slick / Unpaved	Standing Water	Total Road Conditions %	Dark - No Lights	Dark – No Lights Conditions %
<b>Collier Blvd Intersections</b>						
Collier Blvd at Davis Blvd/Beck Blvd	82	11	0	13%	1	1%
Collier Blvd at I-75 SB Ramps	31	2	0	6%	0	0%

## 2.4 Crash Severity

**Table 12** summarizes crashes for the study area by severity. Of the 214 total crashes, there were zero fatal crashes, 92 crashes involving personal injury, and 122 crashes that were property damage only. The FDOT KABCO crash costs from the FDOT Florida Design Manual 2020 edition are summarized in **Table 13**.

Table 12: Crash Severity Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Fatal	0	0	0	0	0	0	0.0	0.0%
Severe Injury	0	0	0	0	1	1	0.2	0.5%

<b>Total</b>	<b>42</b>	<b>39</b>	<b>42</b>	<b>34</b>	<b>54</b>	<b>211</b>	<b>42.2</b>	<b>100.0%</b>

Table 13: FDOT KABCO Crash Costs

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$10,670,000
Severe Injury (A)	\$872,612
Moderate Injury (B)	\$174,018
Minor Injury (C)	\$106,215
Property Damage Only (O)	\$7,700

**Table 14**, **Table 15**, and **Table 16** summarize crash severity and comprehensive crash cost by location for arterial segments, intersections, and interstate segments, respectively. Locations without crashes are excluded from these tables. Overall, there were zero fatal crashes, one severe injury crash, 28 moderate injury crashes, 63 minor injury crashes, and 122 property damage only crashes. These crashes had an estimated comprehensive crash cost of \$13,376,061, which is an average of \$2,675,212 per year. **Figure 5** shows crashes by severity within the study area. The average cost per crash at each location was calculated by dividing the total crash cost by the total crashes. This was then compared to the statewide average cost per crash based on the FDOT Average Crash Costs by Facility Type Table 122.6.1 from the FDOT Design Manual 2020.. These tables and the summary of the statewide average cost per crash are included in **Appendix F**. Overall, zero locations had cost per crash higher than the statewide average. The location with the highest comprehensive crash cost was Collier Boulevard at Davis Boulevard, with an estimated total five-year crash cost of \$4,227,789. The location with the highest average cost per crash was southbound I-75 on-ramp from Collier Boulevard, with an average cost per crash of \$106,215.

*DRAFT*

**SAFETY MEMORANDUM**

**Golden Gate Parkway and Santa Barbara Boulevard at I-  
75**

WPI Segment No.: 442519-2

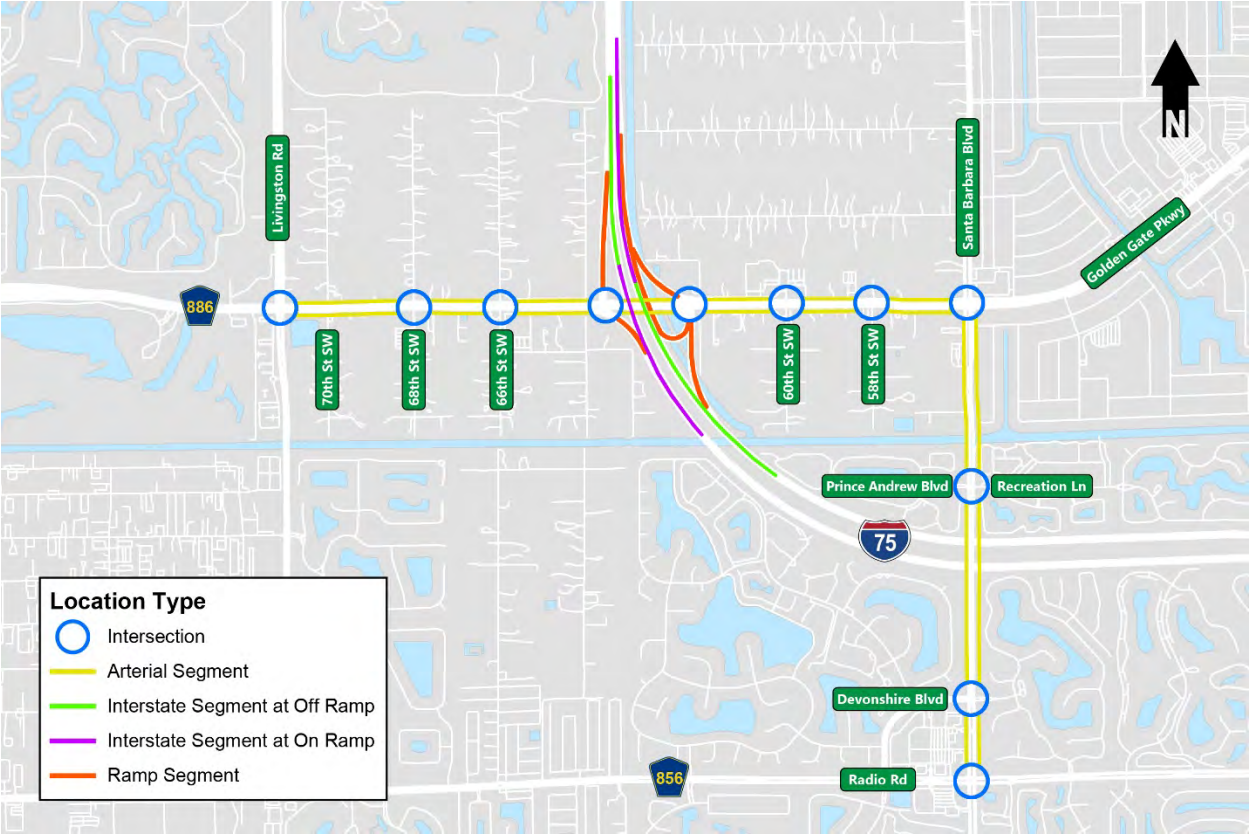

**Florida Department of Transportation**

**April 2021**

# 1.0 Historical Crash Data

The study area includes Golden Gate Parkway from Livingston Road to Santa Barbara Boulevard, Santa Barbara Boulevard from Golden Gate Parkway to Radio Road, and I-75 from south of Golden Gate Parkway to north of Golden Gate Parkway as well as the on- and off-ramps for the interchange. Crash data was obtained for the study area from FDOT’s Crash Analysis Reporting (CAR) Online and the University of Florida’s Signal Four (S4) crash database for the five-year analysis period from 2013 to 2017. **Figure 1** shows the division of the study area into intersection and segment locations. The intersection locations include a 250-foot influence area from the center of the intersection based on FDOT’s spot location crash rate calculations, and the segments on the arterial include the roadway between intersections. On the interstate, the mainline segments have been divided into one segment per ramp gore point. The off-ramp segments begin 1,500 feet upstream of the off-ramp gore points and extend to the halfway point between the off-ramp and on-ramp gore points. The on-ramp segments extend from that halfway point to 1,500 feet downstream of the on-ramp gore points.

Figure 1: Study Area Locations

**Table 1** summarizes the number of crashes, vehicles, fatalities, and injuries that occurred during each of the analysis years. Roadways without any crashes are not included in this table. A total of 525 crashes involving 1,048 vehicles occurred during the analysis period resulting in three fatalities and 304 injuries. This crash data is included in **Appendix F**. A majority of crashes occurred at the Golden Gate Parkway intersections. While crash frequency has varied year to year, overall it has increased from 2013 to 2017.

## 2.0 Crash Analysis

### 2.1 Historical Crash Rates

The crash rate at each location was calculated using the Federal Highway Administration's (FHWA's) crash rate formula adapted for million vehicle miles traveled as follows<sup>1</sup>:

$$\text{Crash Rate} = \frac{1,000,000 * C}{365 * N * V * L}$$

Where

- C = Total number of crashes for the analysis period.
- N = Number of years in the analysis period.
- V = Average Annual Average Daily Traffic (AADT) per year on the roadway segment or entering the intersection during the analysis period.
- L = The length of the roadway segment when analyzing roadway segments, or 1 when analyzing intersections.

Each crash rate was then compared to the statewide average for that facility type using the procedure detailed in the FDOT CARS User Manual to determine the level of confidence that a location's crash rate is higher than the statewide average from the FDOT CARS database for 2013-2017 for a location's facility type (i.e., the high crash confidence). Locations that do not have statewide average crash rates associated with their facility type (e.g., ramp locations) have a statewide average crash rate and high crash confidence percentage listed as N/A.

**Table 2**, **Table 3**, and **Table 4** summarize the crash rates for the arterial segments, arterial intersections, and interstate segment locations respectively. A summary of the statewide average crash rates by facility type for facility types included in these tables can be seen in **Table 5**. The raw CAR output for five-year statewide average crash rates can be found in **Appendix D**. Only the southbound I-75 segment at the Golden Gate Parkway on-ramp has a crash rate that is significantly higher than the statewide average, defined as a high crash confidence of 95 percent or higher. Additionally, the five ramp segments connecting the interstate to the arterial do not have a statewide average crash rate associated with their facility type. **Figure 2** shows each location symbolized according to its high crash confidence. **Figure 3** shows a heat map of crashes for the study area. Crashes tend to cluster at the study area intersections as well as on I-75 at the north end of the study area and on I-75 at the southbound on-ramp.

---

<sup>1</sup> FHWA calculates crash rate in terms of 100 million vehicle-miles traveled. FDOT calculates crash rate in terms of million vehicle-miles traveled, so the constant is adjusted accordingly.

Table 2: Arterial Segment Crash Rates

Segment Location	Total Crashes	5-Year Average AADT	Segment Length (mi)	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*

<b>Total</b>	<b>74</b>	<b>99</b>	<b>109</b>	<b>124</b>	<b>139</b>	<b>545</b>	<b>109.0</b>	<b>100.0%</b>

**Table 7**, **Table 8**, and **Table 9** summarize the most frequent crash type for arterial segments, arterial intersections, and interstate segments, respectively. If more than one crash type tied for the most common crash type, all the tied crash types were listed.

Rear end crashes were the most common on arterial segments and intersections. The Highway Safety Manual (HSM) indicates that possible contributing factors for rear end crashes include inappropriate approach speeds, poor visibility of signals, unexpected lane changes on approach, narrow lanes, unexpected stops on approach, slippery pavement, and excessive speed.

Fixed object crashes were the most common on interstate segments. The HSM indicates that possible contributing factors for fixed object crashes include obstruction in or near roadway, inadequate lighting, inadequate pavement markings; inadequate signs, delineators, guardrail; slippery pavement; roadside design (e.g., inadequate clear distance), inadequate roadway geometry; and excessive speed

**Figure 3** shows a map of crash locations by crash type. Any head-on, bicycle, and pedestrian crashes have been depicted with a star to emphasize crashes that are generally serious in nature. Crash types without any associated crashes are not listed in the legend.

## 2.3 Lighting and Road Surface Conditions

**Table 10** summarizes the lighting, weather, and roadway surface conditions that were present at the time of the crashes. A review of this table indicates that a majority of the crashes occurred during daylight (76.8 percent), clear or cloudy weather conditions (87.6 percent), and on dry roads (82.5 percent).

**Table 10: Crash Conditions Summary**

**Table 11** summarizes wet/slick/unpaved and standing water road surface conditions as well as crashes taking place in dark conditions with no lighting by location for all locations with at least 30 crashes. Of these locations, Golden Gate Parkway at Livingston Road has the highest proportion of wet/slick/unpaved and standing water crashes at 33 percent, and no locations have a crash taking place in dark conditions with no lighting. The method of consolidating road surface conditions and lighting conditions into the classifications shown in **Table 11** is included in **Appendix F**.

## 2.4 Crash Severity

**Table 12** summarizes crashes for the study area by severity. Of the 525 total crashes, there were three fatal crashes, 229 crashes involving personal injury, and 293 crashes that were property damage only. The FDOT KABCO crash costs from the FDOT Florida Design Manual 2020 edition are summarized in **Table 13**.

**Table 12: Crash Severity Summary**

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Fatal	1	0	1	0	1	3	0.6	0.6%
Severe Injury	4	2	2	3	4	15	3.0	2.8%
Moderate Injury	17	15	19	15	12	78	15.6	14.3%
Minor Injury	19	27	29	38	31	144	28.8	26.4%
Property Damage Only	33	55	58	68	91	305	61.0	56.0%
<b>Total</b>	<b>74</b>	<b>99</b>	<b>109</b>	<b>124</b>	<b>139</b>	<b>545</b>		<b>100.0%</b>

**Table 13: FDOT KABCO Crash Costs**

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$10,670,000
Severe Injury (A)	\$872,612
Moderate Injury (B)	\$174,018
Minor Injury (C)	\$106,215
Property Damage Only (O)	\$7,700

**Table 14**, **Table 15**, and **Table 16** summarize crash severity and comprehensive crash cost by location for arterial segments, intersections, and interstate segments, respectively. Locations without crashes are excluded from these tables. Overall, there were three fatal crashes, 15 severe injury crashes, 78 moderate injury crashes, 144 minor injury crashes, and 305 property damage only crashes. These crashes had an estimated comprehensive crash cost of \$76,316,044, which is an average of \$15,263,209 per year. **Figure 5** shows crashes by severity within the study area.

The average cost per crash at each location was calculated by dividing the total crash cost by the total crashes. This was then compared to the statewide average cost per crash based on the FDOT Average Crash Costs by Facility Type Table 122.6.1 from the FDOT Design Manual 2020. These tables and the summary of the statewide average cost per crash are included in **Appendix F**. Overall, four locations had cost per crash higher than the statewide average. The location-specific average cost per crash of these locations is shown in red in the tables below. The location with the highest comprehensive crash cost was Santa Barbara Boulevard at Recreation Lane, with an estimated total five-year crash cost of \$16,078,873. The location with the highest average cost per crash was Golden Gate Parkway at 68th Street Southwest, with an average cost per crash of \$1,117,045.

*DRAFT*

**SAFETY MEMORANDUM**

**Pine Ridge Road at I-75**

WPI Segment No.: 442519-2

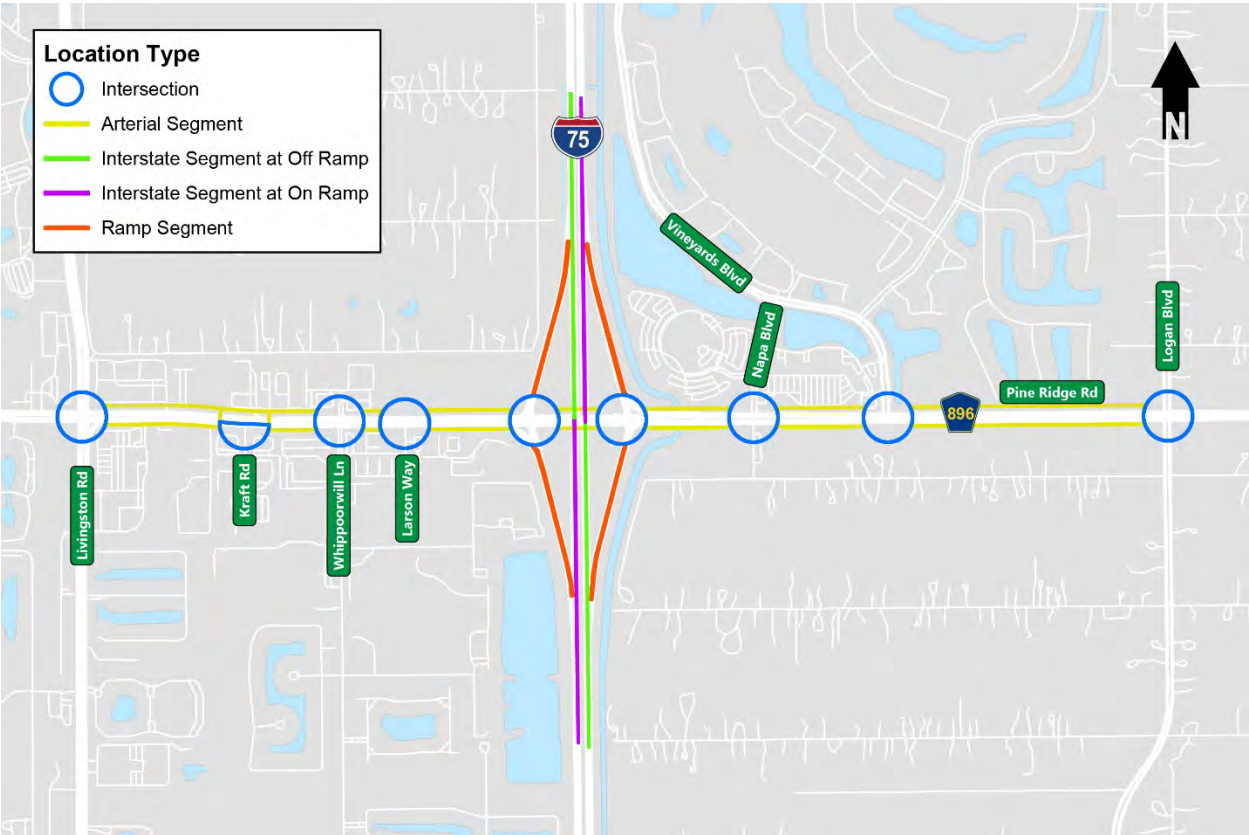

**Florida Department of Transportation**

**April 2021**

# 1.0 Historical Crash Data

The study area includes Pine Ridge Road from Livingston Road to Logan Boulevard and I-75 from south of Pine Ridge Road to north of Pine Ridge Road, as well as the on- and off-ramps for the interchange. Crash data was obtained for the study area from the FDOT's Crash Analysis Reporting (CAR) Online and the University of Florida's Signal Four (S4) crash database for the five-year analysis period from 2013 to 2017. **Figure 1** shows the division of the study area into intersection and segment locations. The intersection locations include a 250-foot influence area from the center of the intersection based on FDOT's spot location crash rate calculations, and the segments on the arterial include the roadway between intersections. On the interstate, the mainline segments have been divided into one segment per ramp gore point. The off-ramp segments begin 1,500 feet upstream of the off-ramp gore points and extend to the halfway point between the off-ramp and on-ramp gore points. The on-ramp segments extend from that halfway point to 1,500 feet downstream of the on-ramp gore points.

Figure 1: Study Area Locations

**Table 1** summarizes the number of crashes, vehicles, fatalities, and injuries that occurred during each of the analysis years. A total of 458 crashes involving 946 vehicles occurred during the analysis period resulting in three fatalities and 314 injuries. This crash data is included in **Appendix A**. A majority of the crashes (365) as well as injuries (268) occurred along Pine Ridge Road. Recent crash data trends indicate that the frequency of crashes is remaining constant or decreasing in the overall study area.

## 2.0 Crash Analysis

### 2.1 Historical Crash Rates

The crash rate at each location was calculated using the Federal Highway Administration's (FHWA's) crash rate formula adapted for million vehicle miles traveled as follows<sup>1</sup>:

$$\text{Crash Rate} = \frac{1,000,000 * C}{365 * N * V * L}$$

Where

- C = Total number of crashes for the analysis period.
- N = Number of years in the analysis period.
- V = Average Annual Average Daily Traffic (AADT) per year on the roadway segment or entering the intersection during the analysis period.
- L = The length of the roadway segment when analyzing roadway segments, or 1 when analyzing intersections.

Each crash rate was then compared to the statewide average for that facility type using the procedure detailed in the FDOT CARS User Manual to determine the level of confidence that a location's crash rate is higher than the statewide average (i.e., high crash confidence percentage) from the FDOT CARS database for 2013-2017 for a location's facility type. Locations that do not have statewide average crash rates associated with their facility type (e.g., ramp segment locations) have a statewide average crash rate and high crash confidence percentage listed as N/A.

**Table 3**, **Table 4**, and **Table 5** summarize the crash rates for the arterial segments, arterial intersections, and interstate segment locations, respectively. A summary of the statewide average crash rates by facility type for facility types included in these tables can be seen in **Table 5**. The raw CAR output for five-year statewide average crash rates can be found in **Appendix D**. No locations have a crash rate that is significantly higher than the statewide average, defined as a high crash confidence of 95 percent or higher. Additionally, the four ramp segments connecting the interstate to the arterial do not have a statewide average crash rate associated with their facility type. **Figure 2** shows each location symbolized according to its high crash confidence. **Figure 3** shows a heat map of crashes for the study area. Crash hotspots include the Livingston Road, Whippoorwill Lane, Napa Boulevard, and Logan Boulevard intersections, as well as I-75 just south of Pine Ridge Road.

---

<sup>1</sup> FHWA calculates crash rate in terms of 100 million vehicle-miles traveled. FDOT calculates crash rate in terms of million vehicle-miles traveled, so the constant is adjusted accordingly.

Table 2: Arterial Segment Crash Rates

<b>Total</b>	<b>69</b>	<b>100</b>	<b>103</b>	<b>99</b>	<b>87</b>	<b>458</b>	<b>91.6</b>	<b>100.0%</b>

**Table 7**, **Table 8**, and **Table 9** summarize the most frequent crash type for arterial segments, arterial intersections, and interstate segments, respectively. If more than one crash type tied for the most common crash type, all the tied crash types were listed. Rear end crashes were the most common on arterial segments, arterial intersections, and interstate segments for the study area. The Highway Safety Manual (HSM) indicates that possible contributing factors for rear end crashes include inappropriate approach speeds, poor visibility of signals, unexpected lane changes on approach, narrow lanes, unexpected stops on approach, slippery pavement, excessive speeds, and restricted sight distance. **Figure 3** shows a map of crash locations by crash type. Any head-on, bicycle, and pedestrian crashes have been depicted with a star to emphasize crashes that are generally serious in nature. Crash types without any associated crashes are not listed in the legend.

Table 7: Arterial Segment Crash Types

Location	Most Common Crash Type	Total of Crash Type	% of Location Total

## 2.3 Lighting and Road Surface Conditions

The HSM indicates that crashes that take place during nighttime or on wet pavement may have design related contributing causes. Table 10 summarizes the lighting, weather, and roadway surface conditions that were present at the time of the crashes. A review of this table indicators that a majority of the crashes occurred during daylight (79.1 percent), in clear or cloudy conditions (79.1 percent), and on dry roadways (74.2 percent).

Table 10: Crash Conditions Summary

**Table 11** summarizes wet/slick/unpaved and standing water road surface conditions as well as crashes taking place in dark conditions with no lighting by location for all locations with at least 30 crashes. Of these locations, Pine Ridge Road at Kramer Drive/Whippoorwill Lane has both the highest proportion of wet/slick/unpaved and standing water crashes (32 percent) and the highest proportion of crashes taking place in dark conditions with no lighting (2 percent). The method of consolidating road surface conditions and lighting conditions into the classifications shown in **Table 11** is included in **Appendix F**.

## 2.4 Crash Severity

**Table 12** summarizes crashes for the study area by severity. Of the 458 total crashes, there were two fatal crashes, 218 crashes involving personal injury, and 238 crashes that were property damage only. The FDOT KABCO crash costs from the FDOT Florida Design Manual 2020 edition are summarized in **Table 13**.

**Table 12: Crash Severity Summary**

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Fatal	1	1	0	0	0	2	0.4	0.4%
Severe Injury	3	7	3	2	4	19	3.8	4.1%
Moderate Injury	17	16	15	13	10	71	14.2	15.5%
Minor Injury	14	37	33	25	19	128	25.6	27.9%
Property Damage Only	34	39	52	59	54	238	47.6	52.0%
<b>Total</b>	<b>69</b>	<b>100</b>	<b>103</b>	<b>99</b>	<b>87</b>	<b>458</b>		<b>100.0%</b>

**Table 13: FDOT KABCO Crash Costs**

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$10,670,000
Severe Injury (A)	\$872,612
Moderate Injury (B)	\$174,018
Minor Injury (C)	\$106,215
Property Damage Only (O)	\$7,700

**Table 14**, **Table 15**, and **Table 16** summarize crash severity and comprehensive crash cost by location for arterial segments, intersections, and interstate segments, respectively. Overall, there were two fatal crashes, 19 severe injury crashes, 71 moderate injury crashes, 128 minor injury crashes, and 238 property damage only crashes. These crashes in the study area had an estimated comprehensive crash cost of \$65,703,026, which is an average of \$13,140,605 per year. **Figure 5** shows crashes by severity within the study area.

The average cost per crash at each location was calculated by dividing the total crash cost by the total crashes. This was then compared to the statewide average cost per crash based on the FDOT Average Crash Costs by Facility Type Table 122.6.1 from the FDOT Design Manual 2020.. These tables and the summary of the statewide average cost per crash are included in **Appendix F**. Overall, four locations had a cost per crash higher than the statewide average. The location-specific average cost per crash of these locations is shown in red in the tables below. The location with the highest economic cost was Pine Ridge Road at Logan Boulevard, with an estimated total five-year crash cost of \$15,688,702. The location with the highest average cost per crash was southbound I-75 at Pine Ridge Road off-ramp, with an average cost per crash of \$618,208.

Table 14: Crash Severity – Arterial

**SAFETY MEMORANDUM**

**Vanderbilt Beach Road at I-75**

WPI Segment No.: 442519-2

**Florida Department of Transportation**

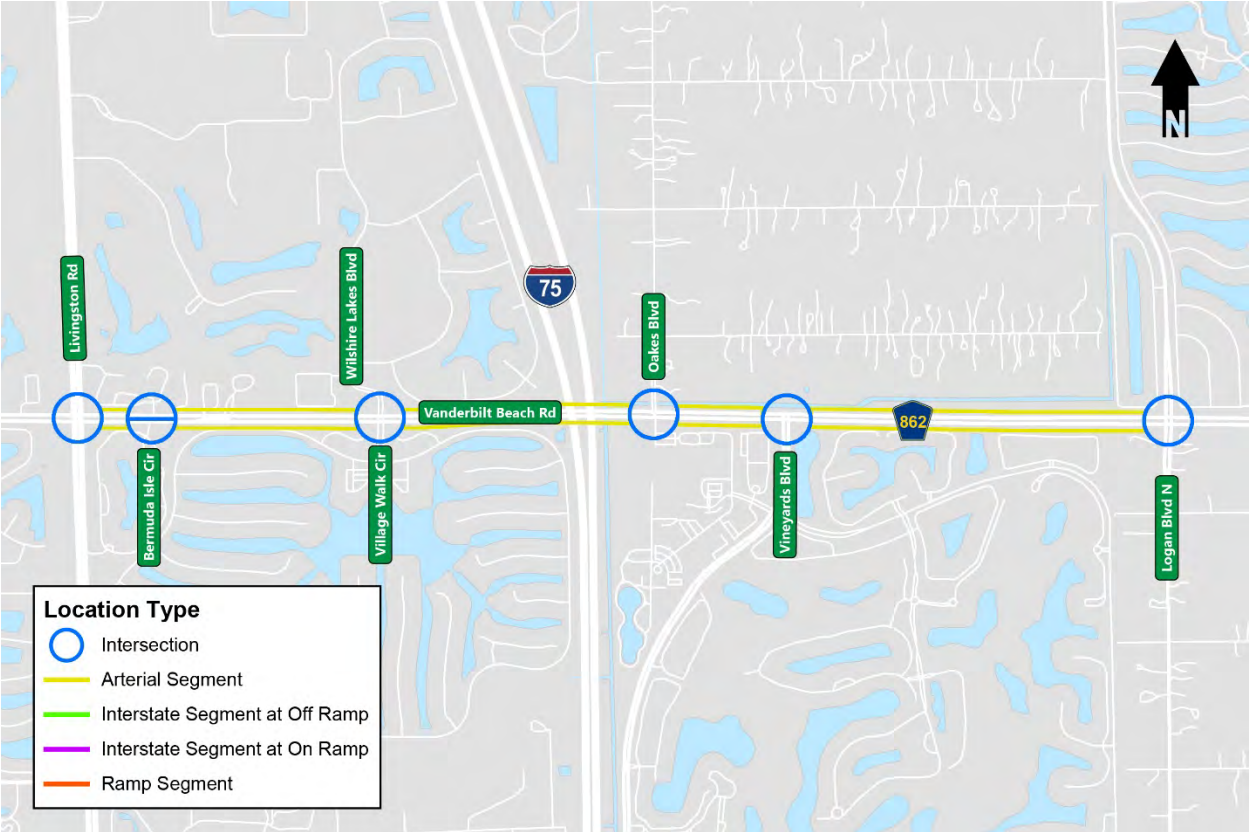

**April 2021**

# 1.0 Historical Crash Data

The study area includes Vanderbilt Beach Road from Livingston Road to Logan Boulevard. Crash data was obtained for the study area from the University of Florida’s Signal Four (S4) crash database for the five-year analysis period from 2013 to 2017. **Figure 1** shows the division of the study area into intersection and segment locations. The intersection locations include a 250-foot influence area from the center of the intersection based on FDOT’s spot location crash rate calculations, and the segments on the arterial include the roadway between intersections.

Figure 1: Study Area Locations

**Table 1** summarizes the number of crashes, vehicles, fatalities, and injuries that occurred during each of the analysis years. Roadways without any crashes are not included in this table. A total of 162 crashes involving 341 vehicles occurred during the analysis period resulting in one fatality and 96 injuries. This crash data is included in **Appendix F**. Most crashes occur at the study area intersections, with crash frequency among segments increasing over time and crash frequency among intersections increasing since 2015.

Table 1: Crash History by Roadway and Year

Roadway	Total Crashes	No. of Vehicles	No. of Fatalities	No. of Injuries
<b>Vanderbilt Beach Rd Intersections</b>				
2013	33	70	0	15
2014	25	50	0	22

<b>Study Area Total</b>	<b>162</b>	<b>341</b>	<b>1</b>	<b>96</b>

## 2.0 Crash Analysis

### 2.1 Historical Crash Rates

The crash rate at each location was calculated using the Federal Highway Administration's (FHWA's) crash rate formula adapted for million vehicle miles traveled as follows<sup>1</sup>:

$$\text{Crash Rate} = \frac{1,000,000 * C}{365 * N * V * L}$$

Where

- C = Total number of crashes for the analysis period.
- N = Number of years in the analysis period.
- V = Average Annual Average Daily Traffic (AADT) per year on the roadway segment or entering the intersection during the analysis period.
- L = The length of the roadway segment when analyzing roadway segments, or 1 when analyzing intersections.

Each crash rate was then compared to the statewide average for that facility type using the procedure detailed in the FDOT CARS User Manual to determine the level of confidence that a location's crash rate is higher than the statewide average from the FDOT CARS database for 2013-2017 for a location's facility type (i.e., the high crash confidence). Locations that do not have statewide average crash rates associated with their facility type (e.g., ramp locations) have a statewide average crash rate and high crash confidence percentage listed as N/A.

**Table 2** and **Table 3** summarize the crash rates for the arterial segments and arterial intersections, respectively. A summary of the statewide average crash rates by facility type for facility types included in these tables can be seen in **Table 4**. The raw CAR output for five-year statewide average crash rates can be found in **Appendix D**. No locations have a crash rate that is significantly higher than the statewide average, defined as a high crash confidence of 95 percent or higher. **Figure 2** shows each location symbolized according to its high crash confidence. **Figure 3** shows a heat map of crashes for the study area. Crashes are seen most frequently at the Livingston Road intersection.

---

<sup>1</sup> FHWA calculates crash rate in terms of 100 million vehicle-miles traveled. FDOT calculates crash rate in terms of million vehicle-miles traveled, so the constant is adjusted accordingly.

Table 2: Arterial Segment Crash Rates

Segment Location	Total Crashes	5-Year Average AADT	Segment Length (mi)	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*
Vanderbilt Beach Rd Between Bermuda Isle Cir and Wilshire Lakes Blvd	7	30,800	0.356	0.350	3.634	1.4	4.21%
Vanderbilt Beach Rd Between Livingston Rd and Bermuda Isle Cir	2	30,800	0.052	0.684	4.714	0.4	1.81%

**Table 6** and **Table 7** summarize the most frequent crash type for arterial segments and arterial intersections, respectively. If more than one crash type tied for the most common crash type, all the tied crash types were listed. Rear end crashes were the most common on both roadway segments and at intersections. The Highway Safety Manual (HSM) indicates that possible contributing factors for rear end crashes include [inappropriate approach speeds, poor visibility of signals, unexpected lane changes on approach, narrow lanes, unexpected stops on approach, slippery pavement, and excessive speed. **Figure 4** shows a map of crash locations by crash type. Any head-on, bicycle, and pedestrian crashes have been depicted with a star to emphasize crashes that are generally serious in nature. Crash types without any associated crashes are not listed in the legend.

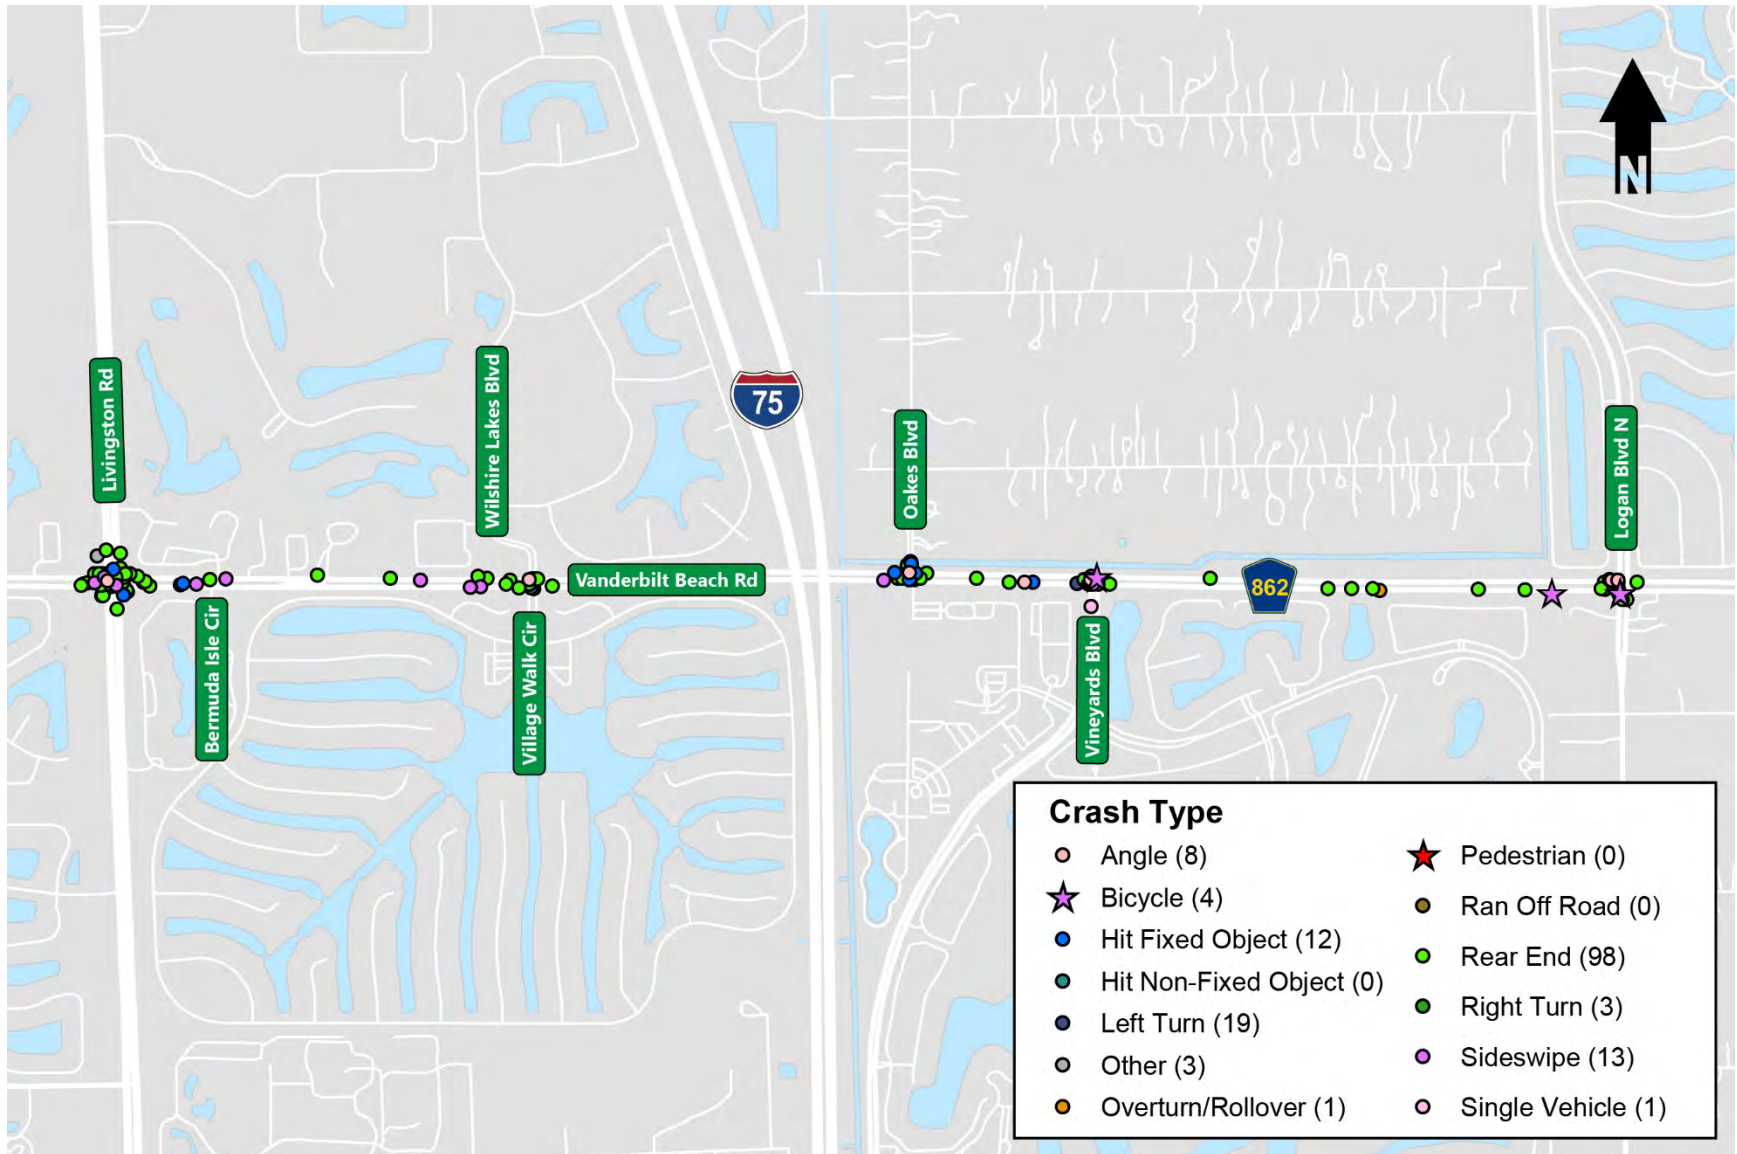

Table 6: Arterial Segment Crash Types

Location	Most Common Crash Type	Total of Crash Type	% of Location Total

## 2.3 Lighting and Road Surface Conditions

The HSM indicates that crashes that take place during nighttime or on wet pavement may have design related contributing causes. **Table 8** summarizes the lighting, weather, and roadway surface conditions that were present at the time of the crashes. A review of this table indicators that a majority of the crashes occurred during daylight (80.2 percent), clear or cloudy weather (88.9 percent) and on dry road (84.6 percent).

**Table 8: Crash Conditions Summary**

## 2.4 Crash Severity

**Table 10** summarizes crashes for the study area by severity. Of the 162 total crashes, there were 67 crashes involving personal injury, one fatal crash, and 94 crashes that were property damage only. The FDOT KABCO crash costs from the FDOT Florida Design Manual 2020 edition are summarized in **Table 11**.

**Table 10: Crash Severity Summary**

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Fatal	0	0	0	0	1	1	0.2	0.6%
Severe Injury	0	0	0	0	1	1	0.2	0.6%
Moderate Injury	4	6	4	2	4	20	4.0	12.3%
Minor Injury	11	7	5	9	14	46	9.2	28.4%
Property Damage Only	19	14	17	23	21	94	18.8	58.0%
<b>Total</b>	<b>34</b>	<b>27</b>	<b>26</b>	<b>34</b>	<b>41</b>	<b>162</b>		<b>100.0%</b>

**Table 11: FDOT KABCO Crash Costs**

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$10,670,000
Severe Injury (A)	\$872,612
Moderate Injury (B)	\$174,018
Minor Injury (C)	\$106,215
Property Damage Only (O)	\$7,700

**Table 12** and **Table 13** summarize crash severity and comprehensive crash cost by location for arterial segments, intersections, and interstate segments, respectively. Locations without crashes are excluded from these tables. Overall, there were 20 moderate injury crashes, one fatal crash, one severe injury crash, 46 minor injury crashes, and 94 property damage only crashes. These crashes had an estimated comprehensive crash cost of \$20,632,662, which is an average of \$4,126,532 per year. **Figure 5** shows crashes by severity within the study area.

The average cost per crash at each location was calculated by dividing the total crash cost by the total crashes. This was then compared to the statewide average cost per crash based on the FDOT Average Crash Costs by Facility Type Table 122.6.1 from the FDOT Design Manual 2020.. These tables and the summary of the statewide average cost per crash are included in **Appendix F**. Overall, only the Vanderbilt Beach Road at Livingston Road had a higher cost per crash than the statewide average. This location also has the highest total five-year crash cost at \$14,106,499. The location with the highest average cost per crash was Vanderbilt Beach Road at Livingston Road, with an average cost per crash of \$247,482.

Table 12: Crash Severity – Arterial

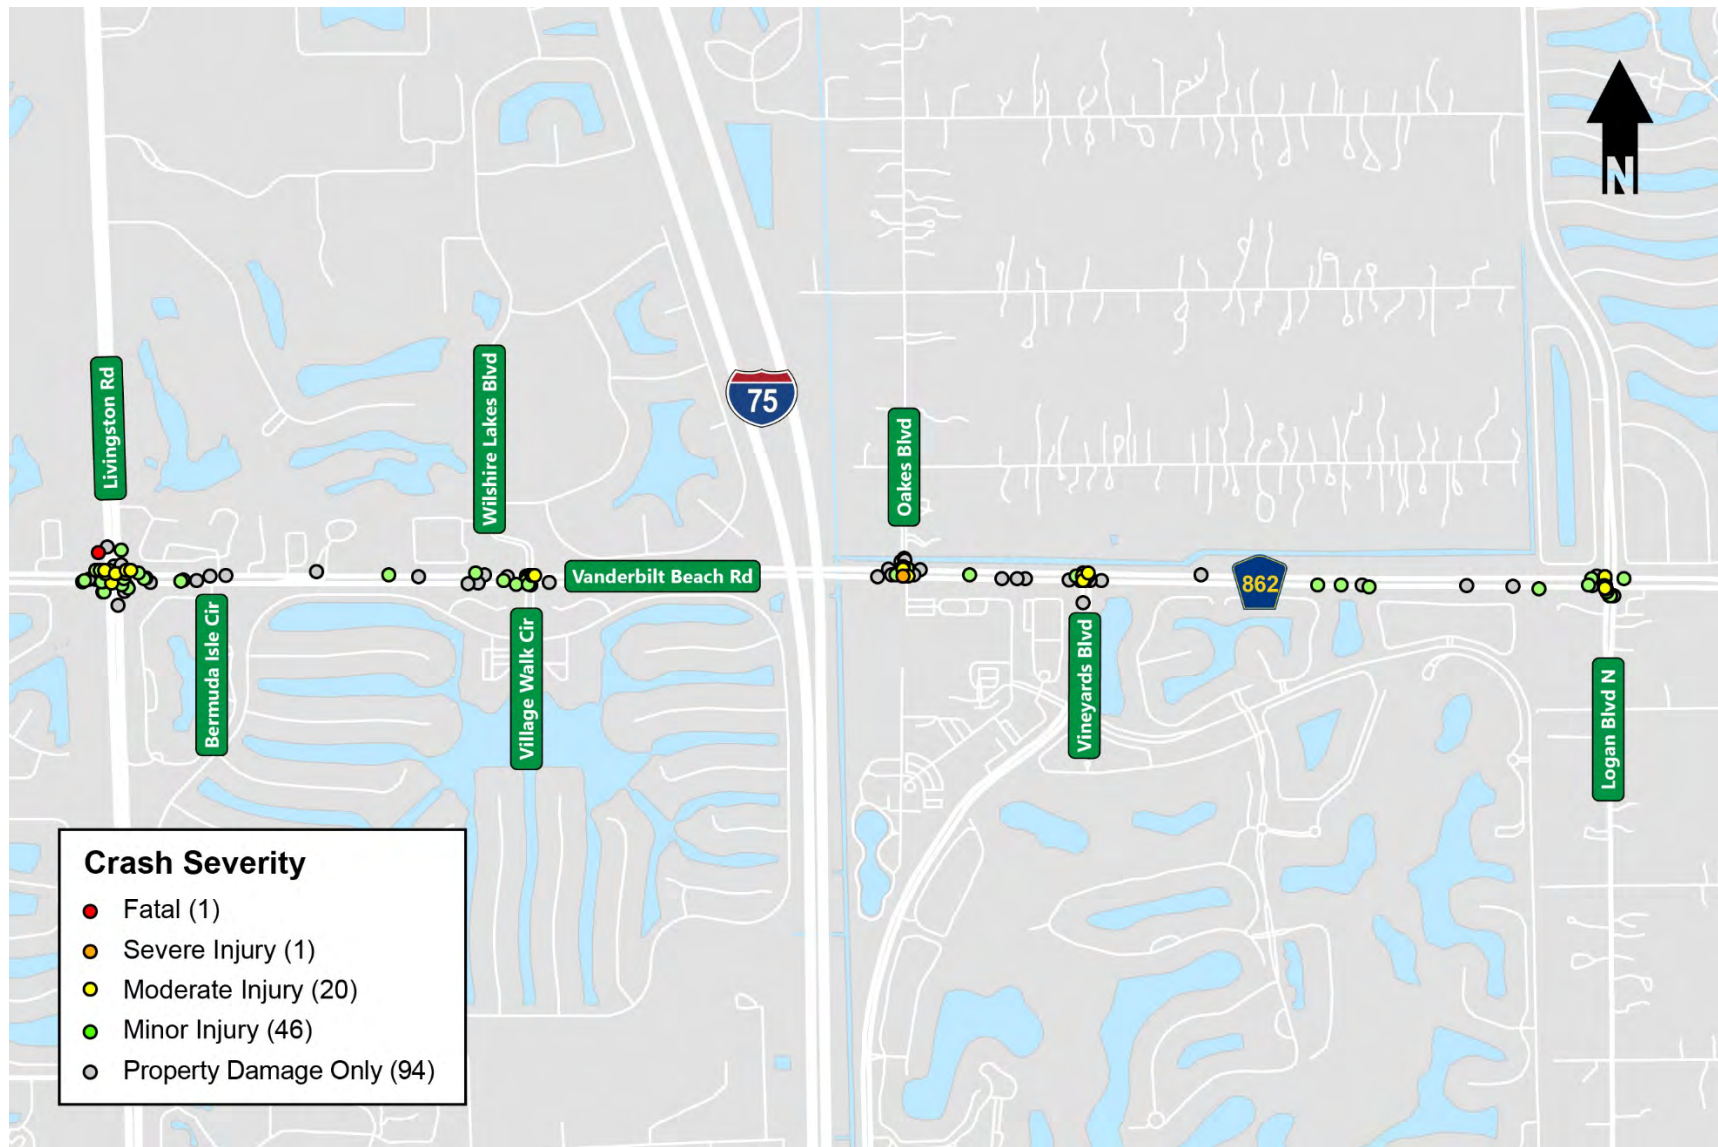

Locations	Fatal	Severe Injury	Moderate Injury	Minor Injury	Property Damage Only	Total Crashes	Total Crash Cost	Location Average Cost Per Crash	State Average Cost Per Crash

*DRAFT*

**SAFETY MEMORANDUM**

**Immokalee Road at I-75**

WPI Segment No.: 442519-2

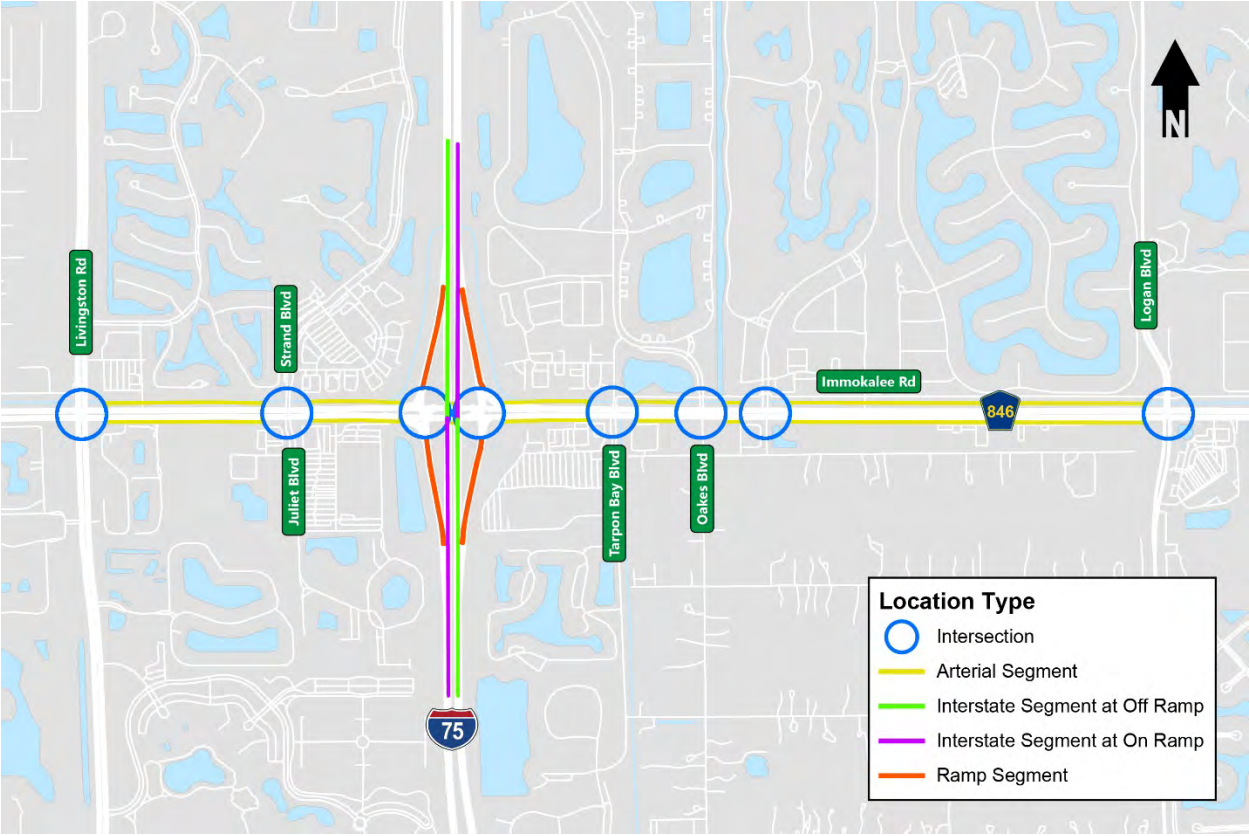

**Florida Department of Transportation**

**April 2021**

# 1.0 Historical Crash Data

The study area includes Immokalee Road from Livingston Road to Logan Boulevard and I-75 from south of Immokalee Road to north of Immokalee Road as well as the on- and off-ramps for the interchange. Crash data was obtained for the study area from FDOT’s Crash Analysis Reporting (CAR) Online and the University of Florida’s Signal Four (S4) crash database for the five-year analysis period from 2013 to 2017. **Figure 1** shows the division of the study area into intersection and segment locations. The intersection locations include a 250-foot influence area from the center of the intersection based on FDOT’s spot location crash rate calculations, and the segments on the arterial include the roadway between intersections. On the interstate, the mainline segments have been divided into one segment per ramp gore point. The off-ramp segments begin 1,500 feet upstream of the off-ramp gore points and extend to the halfway point between the off-ramp and on-ramp gore points. The on-ramp segments extend from that halfway point to 1,500 feet downstream of the on-ramp gore points.

Figure 1: Study Area Locations

**Table 1** summarizes the number of crashes, vehicles, fatalities, and injuries that occurred during each of the analysis years. Roadways without any crashes are not included in this table. A total of 624 crashes involving 1314 vehicles occurred during the analysis period resulting in four fatalities and 347 injuries. This crash data is included in **Appendix F**. The majority of crashes occurred at the Immokalee Rd intersections, accounting for 354 total crashes. However, twice as many crashes occurred on the southbound I-75 segments compared to the northbound I-75 segments. Crash frequency on I-75 has increased steadily throughout the analysis years, while at the arterial intersections the frequency has been fluctuating year to year.

Table 1: Crash History by Roadway and Year

## 2.0 Crash Analysis

### 2.1 Historical Crash Rates

The crash rate at each location was calculated using the Federal Highway Administration's (FHWA's) crash rate formula adapted for million vehicle miles traveled as follows<sup>1</sup>:

$$\text{Crash Rate} = \frac{1,000,000 * C}{365 * N * V * L}$$

Where

- C = Total number of crashes for the analysis period.
- N = Number of years in the analysis period.
- V = Average Annual Average Daily Traffic (AADT) per year on the roadway segment or entering the intersection during the analysis period.
- L = The length of the roadway segment when analyzing roadway segments, or 1 when analyzing intersections.

Each crash rate was then compared to the statewide average for that facility type using the procedure detailed in the FDOT CARS User Manual to determine the level of confidence that a location's crash rate is higher than the statewide average from the FDOT CARS database for 2013-2017 for a location's facility type (i.e., the high crash confidence). Locations that do not have statewide average crash rates associated with their facility type (e.g., ramp locations) have a statewide average crash rate and high crash confidence percentage listed as N/A.

**Table 2**, **Table 3**, and **Table 4** summarize the crash rates for the arterial segments, arterial intersections, and interstate segment locations respectively. A summary of the statewide average crash rates by facility type for facility types included in these tables can be seen in **Table 5**. The raw CAR output for five-year statewide average crash rates can be found in **Appendix D**. Five locations have a crash rate that is significantly higher than the statewide average, defined as a high crash confidence of 95 percent or higher, including Immokalee Rd to the east and west of Oakes Boulevard Ext and at the Northbrooke Drive and Valewood Drive intersections, as well as on the I-75 mainline at the southbound off-ramp. Additionally, the four ramp segments connecting the interstate to the arterial do not have a statewide average crash rate associated with their facility type. **Figure 2** shows each location symbolized according to its high crash confidence. **Figure 3** shows a heat map of crashes for the study area. Crashes tend to cluster most heavily at the study area intersections and at the north end of the study area on I-75. Lighter clusters are visible on Immokalee Road between the ramp terminals and on either side of the Oakes Boulevard Ext. intersection.

---

<sup>1</sup> FHWA calculates crash rate in terms of 100 million vehicle-miles traveled. FDOT calculates crash rate in terms of million vehicle-miles traveled, so the constant is adjusted accordingly.

Table 2: Arterial Segment Crash Rates

Segment Location	Total Crashes	5-Year Average AADT	Segment Length (mi)	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*

**Table 7**, **Table 8**, and **Table 9** summarize the most frequent crash type for arterial segments, arterial intersections, and interstate segments, respectively. If more than one crash type tied for the most common crash type, all the tied crash types were listed. Rear end crashes were the most common arterial segments, arterial intersections, and on interstate segments. The Highway Safety Manual (HSM) indicates that possible contributing factors for rear end crashes include inappropriate approach speeds, poor visibility of signals, unexpected lane changes on approach, narrow lanes, unexpected stops on approach, slippery pavement, and excessive speed. **Figure 3** shows a map of crash locations by crash type. Any head-on, bicycle, and pedestrian crashes have been depicted with a star to emphasize crashes that are generally serious in nature. Crash types without any associated crashes are not listed in the legend.

Table 7: Arterial Segment Crash Types

Location	Most Common Crash Type	Total of Crash Type	% of Location Total
Livingston Rd to Juliet Blvd	Rear End	20	71.4%

### 2.3 Lighting and Road Surface Conditions

The HSM indicates that crashes that take place during nighttime or on wet pavement may have design related contributing causes. **Table 10** summarizes the lighting, weather, and roadway surface conditions that were present at the time of the crashes. A review of this table indicators that a majority of the crashes occurred during daylight (75.5 percent), in clear or cloudy weather conditions (87.8 percent), and on dry road (82.9 percent).

Table 10: Crash Conditions Summary

**Table 11** summarizes wet/slick/unpaved and standing water road surface conditions as well as crashes taking place in dark conditions with no lighting by location for all locations with at least 30 crashes. Of these locations, Immokalee Road at Livingston Road has the highest proportion of wet/slick/unpaved and standing water crashes at 26 percent, and southbound I-75 at on-ramp from Immokalee Road has the highest proportion of crashes taking place in dark conditions with no lighting

at 19 percent. The method of consolidating road surface conditions and lighting conditions into the classifications shown in **Table 11** is included in **Appendix F**.

Table 11: Crash Cause Summary

## 2.4 Crash Severity

**Table 12** summarizes crashes for the study area by severity. Of the 624 total crashes, there were four fatal crashes, 242 crashes involving personal injury, and 378 crashes that were property damage only. The FDOT KABCO crash costs from the FDOT Florida Design Manual 2020 edition are summarized in **Table 13**.

**Table 12: Crash Severity Summary**

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Fatal	0	2	0	2	0	4	0.8	0.6%
Severe Injury	7	2	1	2	9	21	4.2	3.4%
Moderate Injury	21	13	13	15	15	77	15.4	12.3%
Minor Injury	23	27	21	27	46	144	28.8	23.1%
Property Damage Only	45	69	84	85	95	378	75.6	60.6%
<b>Total</b>	<b>96</b>	<b>113</b>	<b>119</b>	<b>131</b>	<b>165</b>	<b>624</b>		<b>100.0%</b>

**Table 13: FDOT KABCO Crash Costs**

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$10,670,000
Severe Injury (A)	\$872,612
Moderate Injury (B)	\$174,018
Minor Injury (C)	\$106,215
Property Damage Only (O)	\$7,700

**Table 14**, **Table 15**, and **Table 16** summarize crash severity and comprehensive crash cost by location for arterial segments, intersections, and interstate segments, respectively. Locations without crashes are excluded from these tables. Overall, there were four fatal crashes, 21 severe injury crashes, 77 moderate injury crashes, 144 minor injury crashes, and 378 property damage only crashes. These crashes had an estimated comprehensive crash cost of \$92,609,798, which is an average of \$18,521,960 per year. **Figure 5** shows crashes by severity within the study area.

The average cost per crash at each location was calculated by dividing the total crash cost by the total crashes. This was then compared to the statewide average cost per crash based on the FDOT Average Crash Costs by Facility Type Table 122.6.1 from the FDOT Design Manual 2020.. These tables and the summary of the statewide average cost per crash are included in **Appendix F**. Overall, four locations had cost per crash higher than the statewide average. The location-specific average cost per crash of these locations is shown in red in the tables below. The location with the highest comprehensive crash cost was the intersection of Immokalee Road at Northbrooke Drive, with an estimated total five-year crash cost of \$26,551,114. The location with the highest average cost per crash was Immokalee Road at I-75 northbound ramps, with an average cost per crash of \$658,074.

Table 14: Crash Severity – Arterial

Locations	Fatal	Severe Injury	Moderate Injury	Minor Injury	Property Damage Only	Total Crashes	Total Crash Cost	Location Average Cost Per Crash	State Average Cost Per Crash

*DRAFT*

**SAFETY MEMORANDUM**

**I-75 at Bonita Beach Road**

WPI Segment No.: 442519-3

**Florida Department of Transportation**

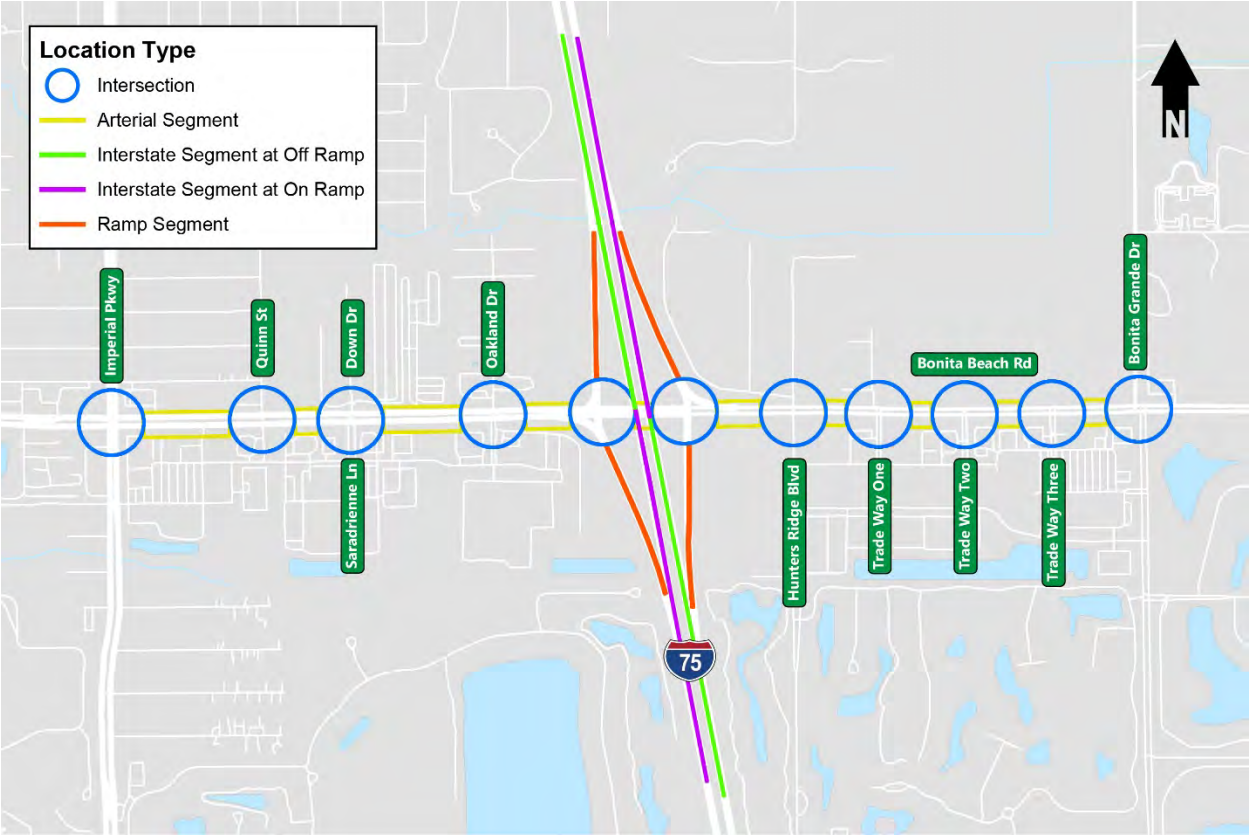

**April 2021**

# 1.0 Historical Crash Data

The study area includes Bonita Beach Road from Imperial Street to Bonita Grande Drive and I-75 from south of Bonita Beach Road to north of Bonita Beach Road as well as the on- and off-ramps for the interchange. Crash data was obtained for the study area from FDOT’s Crash Analysis Reporting (CAR) Online and the University of Florida’s Signal Four (S4) crash database for the five-year analysis period from 2013 to 2017. **Figure 1** shows the division of the study area into intersection and segment locations. The intersection locations include a 250-foot influence area from the center of the intersection based on FDOT’s spot location crash rate calculations, and the segments on the arterial include the roadway between intersections. On the interstate, the mainline segments have been divided into one segment per ramp gore point. The off-ramp segments begin 1,500 feet upstream of the off-ramp gore points and extend to the halfway point between the off-ramp and on-ramp gore points. The on-ramp segments extend from that halfway point to 1,500 feet downstream of the on-ramp gore points.

Figure 1: Study Area Locations

**Table 1** summarizes the number of crashes, vehicles, fatalities, and injuries that occurred during each of the analysis years. Roadways without any crashes are not included in this table. A total of 209 crashes involving 406 vehicles occurred during the analysis period resulting in three fatalities and 125 injuries. This crash data is included in **Appendix F**. Crashes are closely divided among northbound I-75, southbound I-75, and at Bonita Beach Road intersections. On I-75, crashes since 2013 but have remained relatively constant or in decline in recent years. On Bonita Beach Road, crashes have remained relatively constant except for a drop in crash frequency during 2016.

## 2.0 Crash Analysis

### 2.1 Historical Crash Rates

The crash rate at each location was calculated using the Federal Highway Administration's (FHWA's) crash rate formula adapted for million vehicle miles traveled as follows<sup>1</sup>:

$$\text{Crash Rate} = \frac{1,000,000 * C}{365 * N * V * L}$$

Where

- C = Total number of crashes for the analysis period.
- N = Number of years in the analysis period.
- V = Average Annual Average Daily Traffic (AADT) per year on the roadway segment or entering the intersection during the analysis period.
- L = The length of the roadway segment when analyzing roadway segments, or 1 when analyzing intersections.

Each crash rate was then compared to the statewide average for that facility type using the procedure detailed in the FDOT CARS User Manual to determine the level of confidence that a location's crash rate is higher than the statewide average from the FDOT CARS database for 2013-2017 for a location's facility type (i.e., the high crash confidence). Locations that do not have statewide average crash rates associated with their facility type (e.g., ramp locations) have a statewide average crash rate and high crash confidence percentage listed as N/A.

**Table 2**, **Table 3**, and **Table 4** summarize the crash rates for the arterial segments, arterial intersections, and interstate segment locations, respectively. A summary of the statewide average crash rates by facility type for facility types included in these tables can be seen in **Table 5**. The raw CAR output for five-year statewide average crash rates can be found in **Appendix D**. No locations have a crash rate that is significantly higher than the statewide average, defined as a high crash confidence of 95 percent or higher. Additionally, the four ramp segments connecting the interstate to the arterial do not have a statewide average crash rate associated with their facility type. **Figure 2** shows each location symbolized according to its high crash confidence. **Figure 3** shows a heat map of crashes for the study area. Crashes tend to cluster around the Imperial Street intersection, on the north and south ends of I-75, and also in the middle of the interchange on I-75 just south of Bonita Beach Road.

---

<sup>1</sup> FHWA calculates crash rate in terms of 100 million vehicle-miles traveled. FDOT calculates crash rate in terms of million vehicle-miles traveled, so the constant is adjusted accordingly.

Table 2: Arterial Segment Crash Rates

Segment Location	Total Crashes	5-Year Average AADT	Segment Length (mi)	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*

<b>Total</b>	<b>28</b>	<b>45</b>	<b>44</b>	<b>44</b>	<b>48</b>	<b>209</b>	<b>41.8</b>	<b>100.0%</b>

**Table 7**, **Table 8**, and **Table 9** summarize the most frequent crash type for arterial segments, arterial intersections, and interstate segments, respectively. If more than one crash type tied for the most common crash type, all the tied crash types were listed. Rear end crashes were the most common across all location types. The Highway Safety Manual (HSM) indicates that possible contributing factors for rear end crashes inappropriate approach speeds, poor visibility of signals, unexpected lane changes on approach, narrow lanes, unexpected stops on approach, slippery pavement, and excessive speed. **Figure 3** shows a map of crash locations by crash type. Any head-on, bicycle, and pedestrian crashes have been depicted with a star to emphasize crashes that are generally serious in nature. Crash types without any associated crashes are not listed in the legend.

Table 7: Arterial Segment Crash Types

Figure 4: Map of Crash Locations by Type

## 2.3 Lighting and Road Surface Conditions

The HSM indicates that crashes that take place during nighttime or on wet pavement may have design related contributing causes. **Table 10** summarizes crashes by lighting, roadway surface, and weather condition for the entire study area. A review of this table indicates that a majority of the crashes occurred during daylight (78.9 percent) with clear or cloudy weather (87.6 percent) and dry roads (81.3 percent).

**Table 10: Crash Conditions Summary**

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage

**Table 11** summarizes wet/slick/unpaved and standing water road surface conditions as well as crashes taking place in dark conditions with no lighting by location for all locations with at least 30 crashes. Of these locations, northbound I-75 at off-ramp to Bonita Beach Road has the highest proportion of wet/slick/unpaved and standing water crashes at 23 percent, and southbound I-75 at on-ramp from Bonita Beach Road has the highest proportion of crashes taking place in dark conditions with no lighting at 22 percent. The method of consolidating road surface conditions and lighting conditions into the classifications shown in **Table 11** is included in **Appendix F**.

Table 11: Crash Cause Summary

## 2.4 Crash Severity

**Table 12** summarizes crashes for the study area by severity. Of the 209 total crashes, there were three fatal crashes, 71 crashes involving personal injury, and 135 crashes that were property damage only. The FDOT KABCO crash costs from the FDOT Florida Design Manual 2020 edition are summarized in **Table 13**.

**Table 12: Crash Severity Summary**

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Fatal	0	0	0	0	3	3	0.6	1.4%
Severe Injury	0	0	1	2	1	4	0.8	1.9%
Moderate Injury	4	8	5	5	4	26	5.2	12.4%
Minor Injury	3	11	6	10	11	41	8.2	19.6%
Property Damage Only	21	26	32	27	29	135	27.0	64.6%
<b>Total</b>	<b>28</b>	<b>45</b>	<b>44</b>	<b>44</b>	<b>48</b>	<b>209</b>		<b>100.0%</b>

**Table 13: FDOT KABCO Crash Costs**

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$10,670,000
Severe Injury (A)	\$872,612
Moderate Injury (B)	\$174,018
Minor Injury (C)	\$106,215
Property Damage Only (O)	\$7,700

**Table 14**, **Table 15**, and **Table 16** summarize crash severity and comprehensive crash cost by location for arterial segments, intersections, and interstate segments, respectively. Locations without crashes are excluded from these tables. Overall, there were three fatal crashes, four severe injury crashes, 26 moderate injury crashes, 41 minor injury crashes, and 135 property damage only crashes. These crashes had an estimated comprehensive crash cost of \$45,419,231, which is an average of \$9,083,846 per year. **Figure 5** shows crashes by severity within the study area.

The average cost per crash at each location was calculated by dividing the total crash cost by the total crashes. This was then compared to the statewide average cost per crash based on the FDOT Average Crash Costs by Facility Type Table 122.6.1 from the FDOT Design Manual 2020.I. These tables and the summary of the statewide average cost per crash are included in **Appendix F**. Overall, two locations had a cost per crash higher than the statewide average. The location-specific average cost per crash of these locations is shown in red in the tables below. The location with the highest comprehensive crash cost was Bonita Beach Road at Bonita Grande Drive, with an estimated total five-year crash cost of \$21,363,100. The location with the highest average cost per crash was Bonita Beach Road at Quinn Street, with an average cost per crash of \$5,338,850.

Table 14: Crash Severity – Arterial

Locations	Fatal	Severe Injury	Moderate Injury	Minor Injury	Property Damage Only	Total Crashes	Total Crash Cost	Location Average Cost Per Crash	State Average Cost Per Crash

Figure 5: Map of Crash Locations by Severity

## 2.5 Contributing Causes

A summary of crashes by driver contributing cause for the high crash locations is shown in **Table 17**. Among the contributing causes documented in the crash data, careless/negligent driving (74 crashes, 35.4 percent) and no contributing action (34 crashes, 16.3 percent) were among the highest.

**Table 17: Contributing Causes Summary**

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage

*DRAFT*

**SAFETY MEMORANDUM**

**Corkscrew Road at I-75**

WPI Segment No.: 442519-3

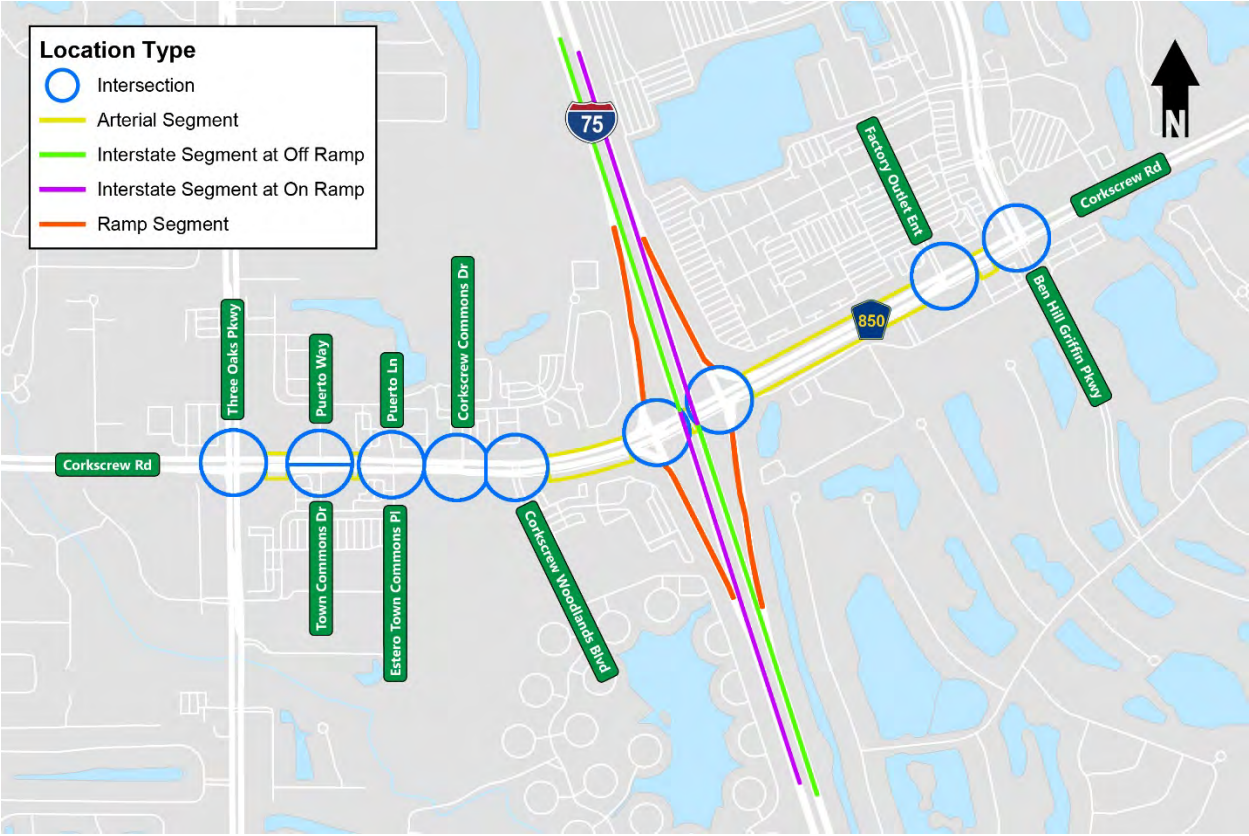

**Florida Department of Transportation**

**April 2021**

# 1.0 Historical Crash Data

The study area includes Corkscrew Road from Three Oaks Parkway to Ben Hill Griffin Parkway / Stony Brook Golf Drive and I-75 from south of Corkscrew Road to north of Corkscrew Road as well as the on- and off-ramps for the interchange. Crash data was obtained for the study area from FDOT's Crash Analysis Reporting (CAR) Online and the University of Florida's Signal Four (S4) crash database for the five-year analysis period from 2013 to 2017. **Figure 1** shows the division of the study area into intersection and segment locations. The intersection locations include a 250-foot influence area from the center of the intersection based on FDOT's spot location crash rate calculations, and the segments on the arterial include the roadway between intersections. On the interstate, the mainline segments have been divided into one segment per ramp gore point. The off-ramp segments begin 1,500 feet upstream of the off-ramp gore points and extend to the halfway point between the off-ramp and on-ramp gore points. The on-ramp segments extend from that halfway point to 1,500 feet downstream of the on-ramp gore points.

Figure 1: Study Area Locations

**Table 1** summarizes the number of crashes, vehicles, fatalities, and injuries that occurred during each of the analysis years. Roadways without any crashes are not included in this table. A total of 363 crashes involving 755 vehicles occurred during the analysis period resulting in five fatalities and 216 injuries. This crash data is included in **Appendix F**. A majority of the crashes occurred at the intersections on Corkscrew Road, accounting for 191 crashes, 434 vehicles, one fatality, and 135 injuries. However, three of the five fatalities occurred on northbound I-75. Other than a sudden drop in crash frequency at the intersections in 2017, crash frequency has been increasing throughout the study area.

## 2.0 Crash Analysis

### 2.1 Historical Crash Rates

The crash rate at each location was calculated using the Federal Highway Administration's (FHWA's) crash rate formula adapted for million vehicle miles traveled as follows<sup>1</sup>:

$$\text{Crash Rate} = \frac{1,000,000 * C}{365 * N * V * L}$$

Where

- C = Total number of crashes for the analysis period.
- N = Number of years in the analysis period.
- V = Average Annual Average Daily Traffic (AADT) per year on the roadway segment or entering the intersection during the analysis period.
- L = The length of the roadway segment when analyzing roadway segments, or 1 when analyzing intersections.

Each crash rate was then compared to the statewide average for that facility type using the procedure detailed in the FDOT CARS User Manual to determine the level of confidence that a location's crash rate is higher than the statewide average from the FDOT CARS database for 2013-2017 for a location's facility type (i.e., the high crash confidence). Locations that do not have statewide average crash rates associated with their facility type (e.g., ramp locations) have a statewide average crash rate and high crash confidence percentage listed as N/A.

**Table 2**, **Table 3**, and **Table 4** summarize the crash rates for the arterial segments, arterial intersections, and interstate segment locations, respectively. A summary of the statewide average crash rates by facility type for facility types included in these tables can be seen in **Table 5**. The raw CAR output for five-year statewide average crash rates can be found in **Appendix D**. No locations have a crash rate that is significantly higher than the statewide average, defined as a high crash confidence of 95 percent or higher. Additionally, the four ramp segments connecting the interstate to the arterial do not have a statewide average crash rate associated with their facility type. **Figure 2** shows each location symbolized according to its high crash confidence. **Figure 3** shows a heat map of crashes for the study area. Crash clusters are visible at the intersections of Three Oaks Parkway, the I-75 southbound ramp terminal, and at Ben Hill Griffin Parkway; as well as at the south end of the study area on I-75.

---

<sup>1</sup> FHWA calculates crash rate in terms of 100 million vehicle-miles traveled. FDOT calculates crash rate in terms of million vehicle-miles traveled, so the constant is adjusted accordingly.

Table 2: Arterial Segment Crash Rates

Segment Location	Total Crashes	5-Year Average AADT	Segment Length (mi)	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*
Three Oaks Pkwy to Puerto Way	1	34,800	0.031	0.508	3.634	0.2	0.87%
Puerto Way to Puente Ln	0	34,800	0.010	0.000	3.634	0	0.00%

<b>Total</b>	<b>50</b>	<b>65</b>	<b>72</b>	<b>96</b>	<b>80</b>	<b>363</b>	<b>72.6</b>	<b>100.0%</b>

**Table 7**, **Table 8**, and **Table 9** summarize the most frequent crash type for arterial segments, arterial intersections, and interstate segments, respectively. If more than one crash type tied for the most common crash type, all the tied crash types were listed. Rear end crashes were the most common on arterial segments, arterial intersections, and interstate segments. The Highway Safety Manual (HSM) indicates that possible contributing factors for rear end crashes include inappropriate approach speeds, poor visibility of signals, unexpected lane changes on approach, narrow lanes, unexpected stops on approach, slippery pavement, and excessive speed. **Figure 3** shows a map of crash locations by crash type. Any head-on, bicycle, and pedestrian crashes have been depicted with a star to emphasize crashes that are generally serious in nature. Crash types without any associated crashes are not listed in the legend.

Table 7: Arterial Segment Crash Types

Location	Most Common Crash Type	Total of Crash Type	% of Location Total

Figure 4: Map of Crash Locations by Type

## 2.3 Lighting and Road Surface Conditions

The HSM indicates that crashes that take place during nighttime or on wet pavement may have design related contributing causes. **Table 10** summarizes the lighting, weather, and roadway surface conditions that were present at the time of the crashes. A review of this table indicators that a majority of the crashes occurred during daylight (76 percent) in clear or cloudy weather (82.1 percent) and on dry roads (82.1 percent).

**Table 10: Crash Conditions Summary**

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage

**Table 11** summarizes wet/slick/unpaved and standing water road surface conditions as well as crashes taking place in dark conditions with no lighting by location for all locations with at least 30 crashes. Of these locations, southbound I-75 at Corkscrew Road on-ramp has the highest proportion of wet/slick/unpaved and standing water crashes at 26 percent, and northbound I-75 at off-ramp to Corkscrew Road has the highest proportion of crashes taking place in dark conditions with no lighting at 24 percent. The method of consolidating road surface conditions and lighting conditions into the classifications shown in **Table 11** is included in **Appendix F**.

Table 11: Crash Cause Summary

Locations	Total Crashes	Wet / Slick / Unpaved	Standing Water	Total Road Conditions %	Dark - No Lights	Dark - No Lights Conditions %

## 2.4 Crash Severity

**Table 12** summarizes crashes for the study area by severity. Of the 363 total crashes, there were three fatal crashes, 129 crashes involving personal injury, and 231 crashes that were property damage only. The FDOT KABCO crash costs from the FDOT Florida Design Manual 2020 edition are summarized in **Table 13**.

**Table 12: Crash Severity Summary**

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Fatal	1	0	0	2	0	3	0.6	0.8%
Severe Injury	3	4	0	4	2	13	2.6	3.6%
Moderate Injury	6	10	14	11	8	49	9.8	13.5%
Minor Injury	11	10	8	24	14	67	13.4	18.5%
Property Damage Only	29	41	50	55	56	231	46.2	63.6%
<b>Total</b>	<b>50</b>	<b>65</b>	<b>72</b>	<b>96</b>	<b>80</b>	<b>363</b>		<b>100.0%</b>

**Table 13: FDOT KABCO Crash Costs**

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$10,670,000
Severe Injury (A)	\$872,612
Moderate Injury (B)	\$174,018
Minor Injury (C)	\$106,215
Property Damage Only (O)	\$7,700

**Table 14**, **Table 15**, and **Table 16** summarize crash severity and comprehensive crash cost by location for arterial segments, intersections, and interstate segments, respectively. Locations without crashes are excluded from these tables. Overall, there were three fatal crashes, 13 severe injury crashes, 49 moderate injury crashes, 67 minor injury crashes, and 230 property damage only crashes. These crashes had an estimated comprehensive crash cost of \$60,775,943, which is an average of \$12,155,189 per year. **Figure 5** shows crashes by severity within the study area.

The average cost per crash at each location was calculated by dividing the total crash cost by the total crashes. This was then compared to the statewide average cost per crash based on the FDOT Average Crash Costs by Facility Type Table 122.6.1 from the FDOT Design Manual 2020.. These tables and the summary of the statewide average cost per crash are included in **Appendix F**. Overall, four locations had cost per crash higher than the statewide average. The location-specific average cost per crash of these locations is shown in red in the tables below. The location with the highest comprehensive crash cost was the northbound I-75 mainline segment at the off-ramp to Corkscrew Road, with an estimated total five-year crash cost of \$13,934,971. The location with the highest average cost per crash was Corkscrew Road at Puente Lane, with an average cost per crash of \$1,361,277.

Table 14: Crash Severity – Arterial

Figure 5: Map of Crash Locations by Severity

## 2.5 Contributing Causes

A summary of crashes by driver contributing cause for the high crash locations is shown in **Table 17**. Among the contributing causes documented in the crash data, careless/negligent driving (154 crashes, 42.4 percent), followed too closely, (44 crashes, 12.1 percent) and no contributing action (44 crashes, 12.1 percent) were among the highest.

**Table 17: Contributing Causes Summary**

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage

**SAFETY MEMORANDUM**

**Alico Road and Terminal Access Road at I-75**

WPI Segment No.: 442519-3

**Florida Department of Transportation**

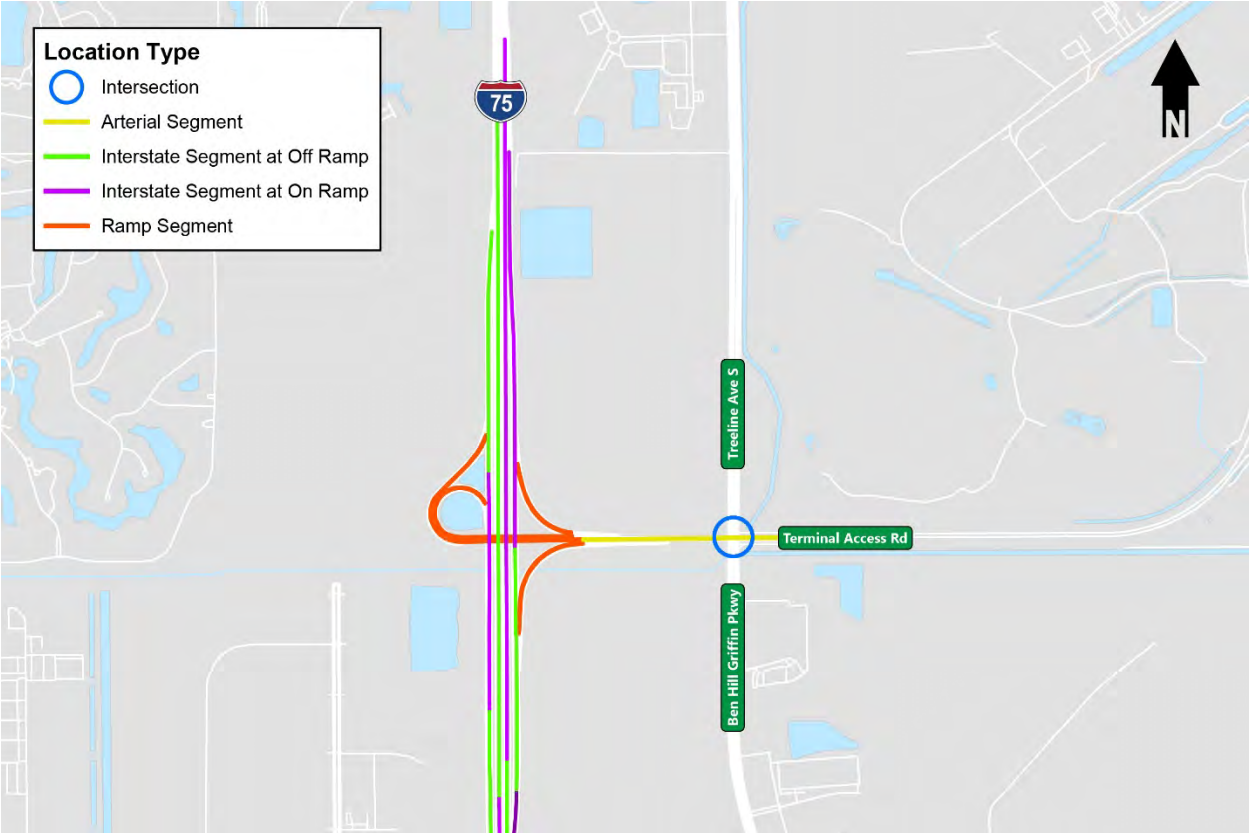

**April 2021**

# 1.0 Historical Crash Data

The study area includes Terminal Access Road from Ben Hill Griffin Parkway to I-75 and Alico Road from Three Oaks Parkway to Ben Hill Griffin Parkway as well as I-75 from south of Alico Road to north of Terminal Access as well as the on- and off-ramps for the interchange and collector-distributor roads. Crash data was obtained for the study area from FDOT's Crash Analysis Reporting (CAR) Online and the University of Florida's Signal Four (S4) crash database for the five-year analysis period from 2013 to 2017. **Figure 1** shows the division of the study area into intersection and segment locations. The intersection locations include a 250-foot influence area from the center of the intersection based on FDOT's spot location crash rate calculations, and the segments on the arterial include the roadway between intersections. On the interstate, the mainline segments and collector distributor roads have been divided into one segment per ramp gore point. The off-ramp segments begin 1,500 feet upstream of the off-ramp gore points and extend to the halfway point between the off-ramp and on-ramp gore points. The on-ramp segments extend from that halfway point to 1,500 feet downstream of the on-ramp gore points.

Figure 1: Study Area Locations

**Table 1** summarizes the number of crashes, vehicles, fatalities, and injuries that occurred during each of the analysis years. Roadways without any crashes are not included in this table. A total of 378 crashes involving 694 vehicles occurred during the analysis period resulting in six fatalities and 226 injuries. This crash data is included in **Appendix F**. Crashes were closely split among Alico Road intersections, and both northbound and southbound I-75 segment. On most roadways, crash frequency has been decreasing since 2015, although crash frequency at the Alico Road intersection continues to fluctuate.

## 2.0 Crash Analysis

### 2.1 Historical Crash Rates

The crash rate at each location was calculated using the Federal Highway Administration's (FHWA's) crash rate formula adapted for million vehicle miles traveled as follows<sup>1</sup>:

$$\text{Crash Rate} = \frac{1,000,000 * C}{365 * N * V * L}$$

Where

- C = Total number of crashes for the analysis period.
- N = Number of years in the analysis period.
- V = Average Annual Average Daily Traffic (AADT) per year on the roadway segment or entering the intersection during the analysis period.
- L = The length of the roadway segment when analyzing roadway segments, or 1 when analyzing intersections.

Each crash rate was then compared to the statewide average for that facility type using the procedure detailed in the FDOT CARS User Manual to determine the level of confidence that a location's crash rate is higher than the statewide average from the FDOT CARS database for 2013-2017 for a location's facility type (i.e., the high crash confidence). Locations that do not have statewide average crash rates associated with their facility type (e.g., ramp locations) have a statewide average crash rate and high crash confidence percentage listed as N/A.

**Table 2**, **Table 3**, and **Table 4** summarize the crash rates for the arterial segments, arterial intersections, and interstate segment locations respectively. A summary of the statewide average crash rates by facility type for facility types included in these tables can be seen in **Table 5**. The raw CAR output for five-year statewide average crash rates can be found in **Appendix D**. No locations have a crash rate that is significantly higher than the statewide average, defined as a high crash confidence of 95 percent or higher. Additionally, the 20 ramp segments connecting the interstate to the arterial do not have a statewide average crash rate associated with their facility type. **Figure 2** shows each location symbolized according to its high crash confidence. **Figure 3** shows a heat map of crashes for the study area. Crashes clusters are visible at both the Alico Road at Three Oaks Parkway intersection and the Alico Road at Ben Hill Griffin Parkway intersection, as well as on I-75 just south of Terminal Access Road.

---

<sup>1</sup> FHWA calculates crash rate in terms of 100 million vehicle-miles traveled. FDOT calculates crash rate in terms of million vehicle-miles traveled, so the constant is adjusted accordingly.

Table 2: Arterial Segment Crash Rates

Segment Location	Total Crashes	5-Year Average AADT	Segment Length (mi)	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*
Three Oaks Pkwy to SB CD Ramp Terminal	12	36,600	0.157	1.144	4.714	2.4	12.13%
I-75 SB to NB CD Terminal	14	36,600	0.213	0.984	4.714	2.8	10.44%
NB CD Terminal to Interstate Commerce Dr	2	25,500	0.200	0.215	4.714	0.4	0.57%
Interstate Commerce Dr to Ben Hill Griffin Pkwy	4	25,500	0.127	0.677	4.714	0.8	3.59%

\* Segments with a High Crash Confidence greater than or equal to 95.00 percent are highlighted in red.

Table 3: Arterial Intersection Crash Rates

Intersection Location	Total Crashes	5-Year Average AADT	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*
Alico Rd at Three Oaks Pkwy	40	44,400	0.494	0.884	8	27.94%

<b>Total</b>	<b>64</b>	<b>90</b>	<b>78</b>	<b>88</b>	<b>58</b>	<b>378</b>	<b>75.6</b>	<b>100.0%</b>

**Table 7**, **Table 8**, and **Table 9** summarize the most frequent crash type for arterial segments, arterial intersections, and interstate segments, respectively. If more than one crash type tied for the most common crash type, all the tied crash types were listed.

Rear end crashes were the most common on arterial segments and intersections. The Highway Safety Manual (HSM) indicates that possible contributing factors for rear end crashes include inappropriate approach speeds, poor visibility of signals, unexpected lane changes on approach, narrow lanes, unexpected stops on approach, slippery pavement, and excessive speed.

Fixed object crashes were the most common on interstate segments. The HSM indicates that possible contributing factors for fixed object crashes include obstruction in or near roadway, inadequate lighting, inadequate pavement markings; inadequate signs, delineators, guardrail; slippery pavement; roadside design (e.g., inadequate clear distance), inadequate roadway geometry; and excessive speed

**Figure 4** shows a map of crash locations by crash type. Any head-on, bicycle, and pedestrian crashes have been depicted with a star to emphasize crashes that are generally serious in nature. Crash types without any associated crashes are not listed in the legend.

Table 7: Arterial Segment Crash Types

Figure 4: Map of Crash Locations by Type

## 2.3 Lighting and Road Surface Conditions

The HSM indicates that crashes that take place during nighttime or on wet pavement may have design related contributing causes. **Table 10** summarizes the lighting, weather, and roadway surface conditions that were present at the time of the crashes. A review of this table indicators that a majority of the crashes occurred during daylight (65.3 percent), clear or cloudy weather conditions, (88.6 percent), and on dry road (81 percent).

**Table 10: Crash Conditions Summary**

**Table 11** summarizes wet/slick/unpaved and standing water road surface conditions as well as crashes taking place in dark conditions with no lighting by location for all locations with at least 30 crashes. Of these locations, northbound I-75 at on-ramp from Terminal Access Road CD System has both the highest proportion of wet/slick/unpaved and standing water crashes (24 percent) and the highest proportion of crashes taking place in dark conditions with no lighting (21 percent). The method of consolidating road surface conditions and lighting conditions into the classifications shown in **Table 11** is included in **Appendix F**.

Table 11: Crash Cause Summary

## 2.4 Crash Severity

**Table 12** summarizes crashes for the study area by severity. Of the 378 total crashes, there were six fatal crashes, 137 crashes involving personal injury, and 235 crashes that were property damage only. The FDOT KABCO crash costs from the FDOT Florida Design Manual 2020 edition are summarized in **Table 13**.

**Table 12: Crash Severity Summary**

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Fatal	2	0	3	0	1	6	1.2	1.6%
Severe Injury	4	6	2	2	1	15	3.0	4.0%
Moderate Injury	11	13	10	11	10	55	11.0	14.6%
Minor Injury	13	15	16	15	8	67	13.4	17.7%
Property Damage Only	34	56	47	60	38	235	47.0	62.2%
<b>Total</b>	<b>64</b>	<b>90</b>	<b>78</b>	<b>88</b>	<b>58</b>	<b>378</b>		<b>100.0%</b>

**Table 13: FDOT KABCO Crash Costs**

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$10,670,000
Severe Injury (A)	\$872,612
Moderate Injury (B)	\$174,018
Minor Injury (C)	\$106,215
Property Damage Only (O)	\$7,700

**Table 13**, **Table 14**, and **Table 15** summarize crash severity and comprehensive crash cost by location for arterial segments, intersections, and interstate segments, respectively. Locations without crashes are excluded from these tables. Overall, there were six fatal crashes, 15 severe injury crashes, 55 moderate injury crashes, 67 minor injury crashes, and 235 property damage only crashes. These crashes had an estimated comprehensive crash cost of \$95,606,075, which is an average of \$19,121,215 per year. **Figure 5** shows crashes by severity within the study area.

The average cost per crash at each location was calculated by dividing the total crash cost by the total crashes. This was then compared to the statewide average cost per crash based on the FDOT Average Crash Costs by Facility Type Table 122.6.1 from the FDOT Design Manual 2020.. These tables and the summary of the statewide average cost per crash are included in **Appendix F**. Overall, eight locations had cost per crash higher than the statewide average. The location-specific average cost per crash of these locations is shown in red in the tables below. The location with the highest comprehensive crash cost was northbound I-75 at the off-ramp to the Alico Road collector distributor system, with an estimated total five-year crash cost of \$38,065,712. The location with the highest average cost per crash was southbound I-75 at off-ramp to Terminal Access Road CD System, with an average cost per crash of \$634,426.

Table 14: Crash Severity – Arterial

Locations	Fatal	Severe Injury	Moderate Injury	Minor Injury	Property Damage Only	Total Crashes	Total Crash Cost	Location Average Cost Per Crash	State Average Cost Per Crash

**SAFETY MEMORANDUM**

**Daniels Parkway at I-75**

WPI Segment No.: 442519-3

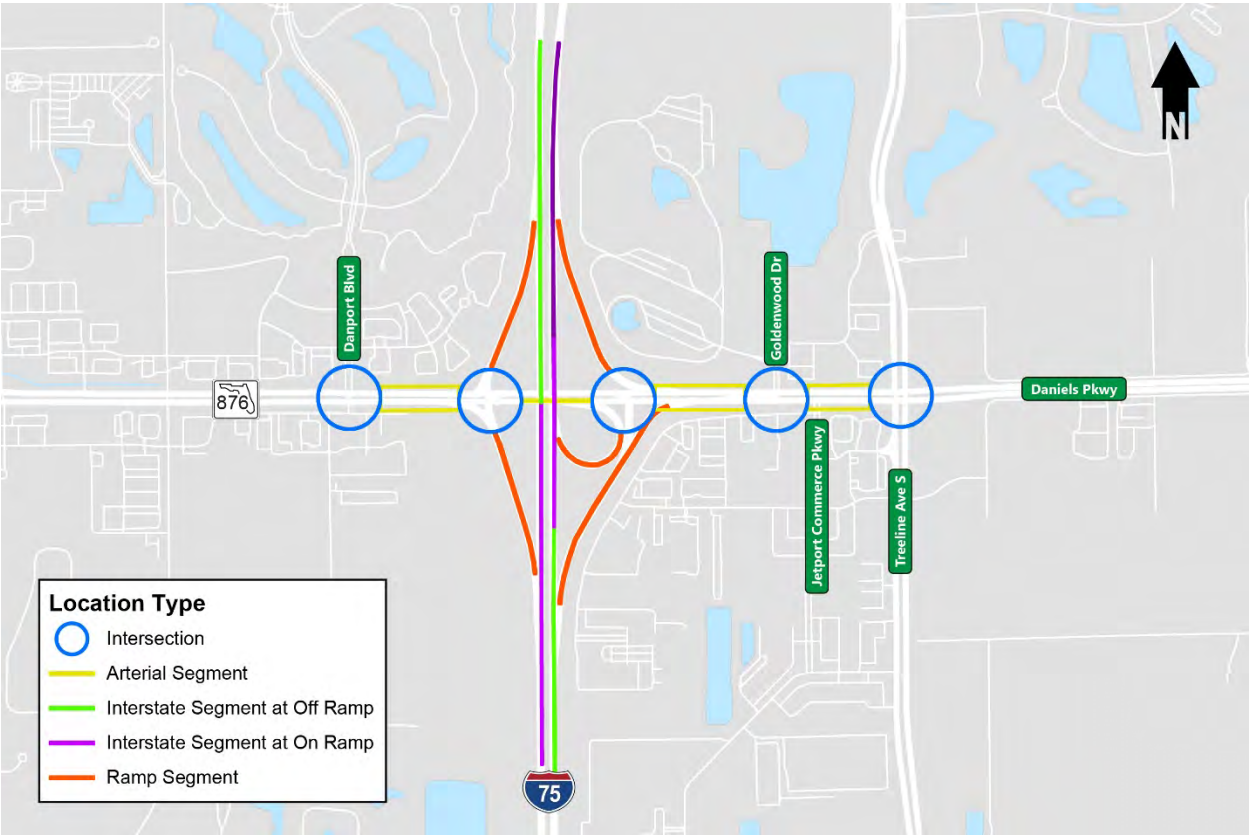

**Florida Department of Transportation**

**April 2021**

# 1.0 Historical Crash Data

The study area includes Daniels Pkwy from Danport Boulevard to Treeline Avenue and I-75 from south of Daniels Parkway to north of Daniels Parkway as well as the on- and off-ramps for the interchange. Crash data was obtained for the study area from the FDOT's Crash Analysis Reporting (CAR) Online and the University of Florida's Signal Four (S4) crash database for the five-year analysis period from 2013 to 2017. **Figure 1** shows the division of the study area into intersection and segment locations. The intersection locations include a 250-foot influence area from the center of the intersection based on FDOT's spot location crash rate calculations, and the segments on the arterial include the roadway between intersections. On the interstate, the mainline segments have been divided into one segment per ramp gore point. The off-ramp segments begin 1,500 feet upstream of the off-ramp gore points and extend to the halfway point between the off-ramp and on-ramp gore points. The on-ramp segments extend from that halfway point to 1,500 feet downstream of the on-ramp gore points.

Figure 1: Study Area Locations

**Table 1** summarizes the number of crashes, vehicles, fatalities, and injuries that occurred during each of the analysis years. Roadways without any crashes are not included in this table. A total of 350 crashes involving 717 vehicles occurred during the analysis period resulting in two fatalities and 234 injuries. This crash data is included in **Appendix F**. A majority of the crashes occurred on Daniels Pkwy at the study area intersections. Crash frequency at the study intersection has increased steadily since 2013, as well as on the I-75 mainline segments in both directions. Crash frequency at other locations has not exhibited consistent patterns.

## 2.0 Crash Analysis

### 2.1 Historical Crash Rates

The crash rate at each location was calculated using the Federal Highway Administration's (FHWA's) crash rate formula adapted for million vehicle miles traveled as follows<sup>1</sup>:

$$\text{Crash Rate} = \frac{1,000,000 * C}{365 * N * V * L}$$

Where

- C = Total number of crashes for the analysis period.
- N = Number of years in the analysis period.
- V = Average Annual Average Daily Traffic (AADT) per year on the roadway segment or entering the intersection during the analysis period.
- L = The length of the roadway segment when analyzing roadway segments, or 1 when analyzing intersections.

Each crash rate was then compared to the statewide average for that facility type using the procedure detailed in the FDOT CARS User Manual to determine the level of confidence that a location's crash rate is higher than the statewide average from the FDOT CARS database for 2013-2017 for a location's facility type (i.e., the high crash confidence). Locations that do not have statewide average crash rates associated with their facility type (e.g., ramp locations) have a statewide average crash rate and high crash confidence percentage listed as N/A.

**Table 2**, **Table 3**, and **Table 4** summarize the crash rates for the arterial segments, arterial intersections, and interstate segment locations respectively. A summary of the statewide average crash rates by facility type for facility types included in these tables can be seen in **Table 5**. The raw CAR output for five-year statewide average crash rates can be found in **Appendix D**. No locations have a crash rate that is significantly higher than the statewide average, defined as a high crash confidence of 95 percent or higher. Additionally, the five ramp segments connecting the interstate to the arterial do not have a statewide average crash rate associated with their facility type. **Figure 2** shows each location symbolized according to its high crash confidence. **Figure 3** shows a heat map of crashes for the study area. Crashes are primarily grouped at the Treeline Avenue intersection, with smaller groupings at the southbound ramp terminal and Danport Boulevard intersections.

---

<sup>1</sup> FHWA calculates crash rate in terms of 100 million vehicle-miles traveled. FDOT calculates crash rate in terms of million vehicle-miles traveled, so the constant is adjusted accordingly.

Table 2: Arterial Segment Crash Rates

Segment Location	Total Crashes	5-Year Average AADT	Segment Length (mi)	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*
Renaissance Way to I-75 SB Ramp Terminal	21	54,600	0.119	1.771	2.711	4.2	32.66%

<b>Total</b>	<b>44</b>	<b>65</b>	<b>68</b>	<b>82</b>	<b>91</b>	<b>350</b>	<b>70.0</b>	<b>100.0%</b>

**Table 7**, **Table 8**, and **Table 9** summarize the most frequent crash type for arterial segments, arterial intersections, and interstate segments, respectively. If more than one crash type tied for the most common crash type, all the tied crash types were listed.

Rear end crashes were the most common at the arterial intersections and on the arterial segments. The Highway Safety Manual (HSM) indicates that possible contributing factors for rear end crashes include inappropriate approach speeds, poor visibility of signals, unexpected lane changes on approach, narrow lanes, unexpected stops on approach, slippery pavement, and excessive speed.

Sideswipe crashes were the most common on the interstate mainline segments. The HSM only includes contributing factors for sideswipe crashes at intersections, and not on segments. However, some of these factors are still relevant to roadway segments, including unexpected lane changes, narrow lanes, unexpected stops on approach, slippery pavement, and excessive speed.

**Figure 3** shows a map of crash locations by crash type. Any head-on, bicycle, and pedestrian crashes have been depicted with a star to emphasize crashes that are generally serious in nature. Crash types without any associated crashes are not listed in the legend.

Table 7: Arterial Segment Crash Types

Location	Most Common Crash Type	Total of Crash Type	% of Location Total

Figure 4: Map of Crash Locations by Type

## 2.3 Lighting and Road Surface Conditions

The HSM indicates that crashes that take place during nighttime or on wet pavement may have design related contributing causes. **Table 10** summarizes the lighting, weather, and roadway surface conditions that were present at the time of the crashes. A review of this table indicators that a majority of the crashes occurred during daylight (73.7 percent), clear or cloudy weather conditions (85.7 percent), and on dry roads (76.3 percent).

**Table 10: Crash Conditions Summary**

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage

**Table 11** summarizes wet/slick/unpaved and standing water road surface conditions as well as crashes taking place in dark conditions with no lighting by location for all locations with at least 30 crashes. Of these locations, Daniels Parkway at I-75 southbound ramps has both the highest proportion of wet/slick/unpaved and standing water crashes (26 percent) and the highest proportion of crashes taking place in dark conditions with no lighting (11 percent). The method of consolidating road surface conditions and lighting conditions into the classifications shown in **Table 11** is included in **Appendix F**.

Table 11: Crash Cause Summary

## 2.4 Crash Severity

**Table 12** summarizes crashes for the study area by severity. Of the 350 total crashes, there were two fatal crashes, 144 crashes involving personal injury, and 204 crashes that were property damage only. The FDOT KABCO crash costs from the FDOT Florida Design Manual 2020 edition are summarized in **Table 13**.

**Table 12: Crash Severity Summary**

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Fatal	0	0	0	1	1	2	0.4	0.6%
Severe Injury	2	2	1	5	4	14	2.8	4.0%
Moderate Injury	6	10	10	11	19	56	11.2	16.0%
Minor Injury	11	10	14	18	21	74	14.8	21.1%
Property Damage Only	25	43	43	47	46	204	40.8	58.3%
<b>Total</b>	<b>44</b>	<b>65</b>	<b>68</b>	<b>82</b>	<b>91</b>	<b>350</b>		<b>100.0%</b>

**Table 13: FDOT KABCO Crash Costs**

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$10,670,000
Severe Injury (A)	\$872,612
Moderate Injury (B)	\$174,018
Minor Injury (C)	\$106,215
Property Damage Only (O)	\$7,700

**Table 14**, **Table 15**, and **Table 16** summarize crash severity and comprehensive crash cost by location for arterial segments, intersections, and interstate segments, respectively. Locations without crashes are excluded from these tables. Overall, there were two fatal crashes, 14 severe injury crashes, 56 moderate injury crashes, 74 minor injury crashes, and 204 property damage only crashes. These crashes had an estimated comprehensive crash cost of \$52,732,286, which is an average of \$10,546,457 per year. **Figure 5** shows crashes by severity within the study area.

The average cost per crash at each location was calculated by dividing the total crash cost by the total crashes. This was then compared to the statewide average cost per crash based on the FDOT Average Crash Costs by Facility Type Table 122.6.1 from the FDOT Design Manual 2020.. These tables and the summary of the statewide average cost per crash are included in **Appendix F**. Overall, three locations had cost per crash higher than the statewide average. The location-specific average cost per crash of these locations is shown in red in the tables below. The location with the highest comprehensive crash cost was the northbound I-75 segment at the on-ramp from Daniels Parkway, with an estimated total five-year crash cost of \$13,643,956. The location with the highest average cost per crash was southbound I-75 at Daniels Parkway on-ramp, with an average cost per crash of \$552,929.

Table 14: Crash Severity – Arterial

Locations	Fatal	Severe Injury	Moderate Injury	Minor Injury	Property Damage Only	Total Crashes	Total Crash Cost	Location Average Cost Per Crash	State Average Cost Per Crash
Daniels Pkwy Between Renaissance Way and I-75 SB Ramp Terminal	0	0	3	7	11	21	\$1,350,259	\$64,298	\$166,258
Daniels Pkwy Between I-75 SB and NB Ramp Terminal	0	0	0	5	13	18	\$631,175	\$35,065	\$166,258
Daniels Pkwy Between I-75 NB Ramp Terminal and Goldenwood Dr	0	0	1	2	2	5	\$401,848	\$80,370	\$166,258

*DRAFT*

**SAFETY MEMORANDUM**

**Colonial Boulevard at I-75**

WPI Segment No.: 442519-3

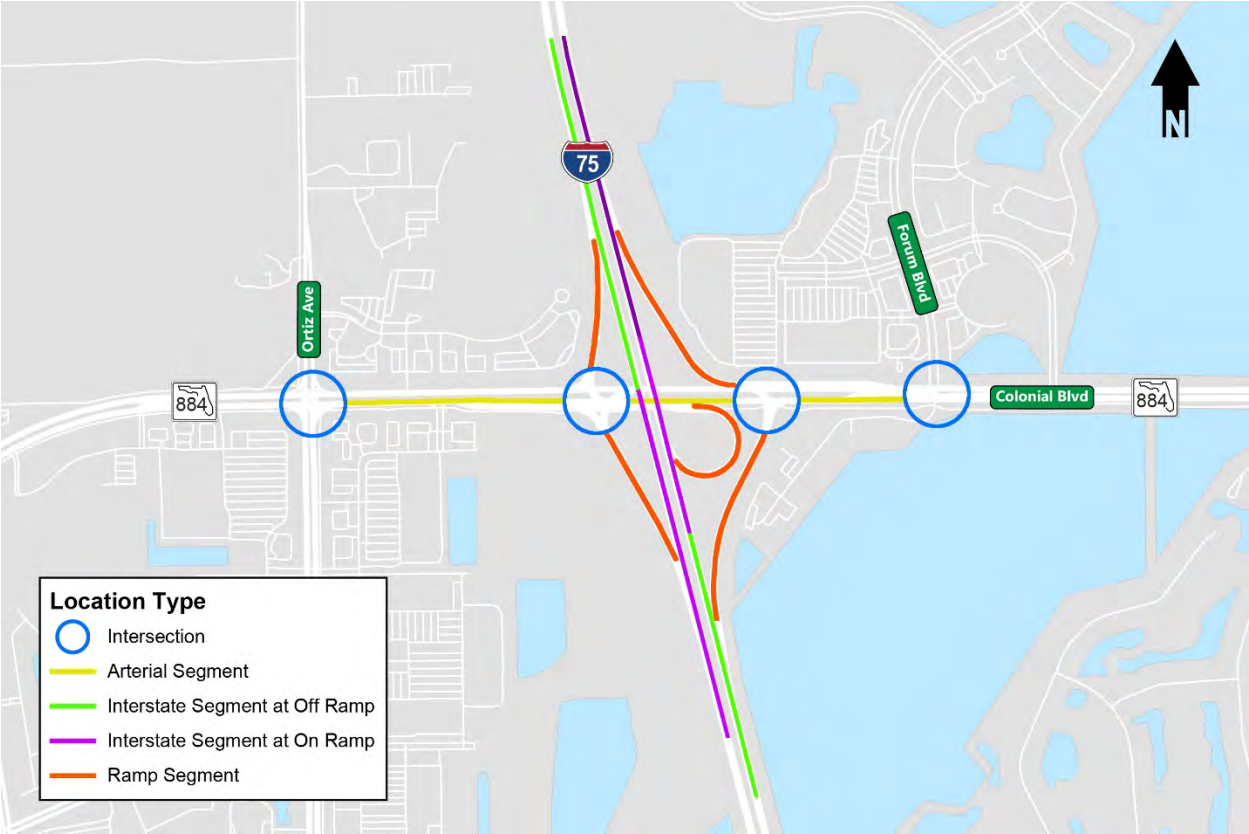

**Florida Department of Transportation**

**April 2021**

# 1.0 Historical Crash Data

The study area includes Colonial Boulevard from Ortiz Avenue / Six Mile Cypress Parkway to Forum Boulevard/ Colonial Court and I-75 from south of Colonial Boulevard to north of Colonial Boulevard as well as the on- and off-ramps for the interchange. Crash data was obtained for the study area from FDOT’s Crash Analysis Reporting (CAR) Online and the University of Florida’s Signal Four (S4) crash database for the five-year analysis period from 2013 to 2017. **Figure 1** shows the division of the study area into intersection and segment locations. The intersection locations include a 250-foot influence area from the center of the intersection based on FDOT’s spot location crash rate calculations, and the segments on the arterial include the roadway between intersections. On the interstate, the mainline segments have been divided into one segment per ramp gore point. The off-ramp segments begin 1,500 feet upstream of the off-ramp gore points and extend to the halfway point between the off-ramp and on-ramp gore points. The on-ramp segments extend from that halfway point to 1,500 feet downstream of the on-ramp gore points.

Figure 1: Study Area Locations

**Table 1** summarizes the number of crashes, vehicles, fatalities, and injuries that occurred during each of the analysis years. Roadways without any crashes are not included in this table. A total of 923 crashes involving 1,962 vehicles occurred during the analysis period resulting in four fatalities and 635 injuries. This crash data is included in **Appendix F**. A majority of crashes take place at the Colonial Boulevard intersections, accounting for 600 crashes, 1,306 vehicles, three fatalities, and 444 injuries. Both the Colonial Boulevard segments and I-75 experienced an increase in crashes since 2015 that has remained elevated above 2014 crash frequency, but crash trends indicate that frequency has

been decreasing or remaining constant since then. Crash frequency at the intersections has fluctuated from year to year, showing no discernable trend.

Table 1: Crash History by Roadway and Year

## 2.0 Crash Analysis

### 2.1 Historical Crash Rates

The crash rate at each location was calculated using the Federal Highway Administration's (FHWA's) crash rate formula adapted for million vehicle miles traveled as follows<sup>1</sup>:

$$\text{Crash Rate} = \frac{1,000,000 * C}{365 * N * V * L}$$

Where

- C = Total number of crashes for the analysis period.
- N = Number of years in the analysis period.
- V = Average Annual Average Daily Traffic (AADT) per year on the roadway segment or entering the intersection during the analysis period.
- L = The length of the roadway segment when analyzing roadway segments, or 1 when analyzing intersections.

Each crash rate was then compared to the statewide average for that facility type using the procedure detailed in the FDOT CARS User Manual to determine the level of confidence that a location's crash rate is higher than the statewide average from the FDOT CARS database for 2013-2017 for a location's facility type (i.e., the high crash confidence). Locations that do not have statewide average crash rates associated with their facility type (e.g., ramp locations) have a statewide average crash rate and high crash confidence percentage listed as N/A.

**Table 2**, **Table 3**, and **Table 4** summarize the crash rates for the arterial segments, arterial intersections, and interstate segment locations respectively. A summary of the statewide average crash rates by facility type for facility types included in these tables can be seen in **Table 5**. The raw CAR output for five-year statewide average crash rates can be found in **Appendix D**. Five locations have a crash rate that is significantly higher than the statewide average, defined as a high crash confidence of 95 percent or higher, including all four intersections, as well as northbound I-75 at the on-ramp from eastbound Colonial Boulevard. Additionally, the five ramp segments connecting the interstate to the arterial do not have a statewide average crash rate associated with their facility type. **Figure 2** shows each location symbolized according to its high crash confidence. **Figure 3** shows a heat map of crashes for the study area. Crash frequency at the intersection locations is notably higher than on the interstate, especially at Ortiz Avenue / Six Mile Cypress Parkway. A cluster of crashes can also be observed on Colonial Boulevard between Ortiz Avenue and the I-75 southbound ramp terminal near the Rolfes Road intersection.

---

<sup>1</sup> FHWA calculates crash rate in terms of 100 million vehicle-miles traveled. FDOT calculates crash rate in terms of million vehicle-miles traveled, so the constant is adjusted accordingly.

Table 2: Arterial Segment Crash Rates

Segment Location	Total Crashes	5-Year Average AADT	Segment Length (mi)	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*
Ortiz Ave to I-75 SB Ramp Terminal	88	80,200	0.322	1.867	2.711	17.6	34.43%
East of I-75 SB Ramp Terminal	49	80,200	0.094	3.561	4.714	9.8	37.77%

<b>Total</b>	<b>184</b>	<b>148</b>	<b>209</b>	<b>209</b>	<b>173</b>	<b>923</b>	<b>184.6</b>	<b>100.0%</b>

**Table 7**, **Table 8**, and **Table 9** summarize the most frequent crash type for arterial segments, arterial intersections, and interstate segments, respectively. If more than one crash type tied for the most common crash type, all the tied crash types were listed.

Rear end crashes were the most common on both arterial segments and intersections. The Highway Safety Manual (HSM) indicates that possible contributing factors for rear end crashes include inappropriate approach speeds, poor visibility of signals, unexpected lane changes on approach, narrow lanes, unexpected stops on approach, slippery pavement, and excessive speed.

Fixed object crashes were the most common on interstate segments. The HSM indicates that possible contributing factors for these crashes include obstruction in or near roadway, inadequate lighting, inadequate pavement markings; inadequate signs, delineators, guardrail; slippery pavement; roadside design (e.g., inadequate clear distance), inadequate roadway geometry; and excessive speed.

**Figure 4** shows a map of crash locations by crash type. Any head-on, bicycle, and pedestrian crashes have been depicted with a star to emphasize crashes that are generally serious in nature. Crash types without any associated crashes are not listed in the legend.

Table 7: Arterial Segment Crash Types

Location	Most Common Crash Type	Total of Crash Type	% of Location Total
Ortiz Ave to I-75 SB Ramp Terminal	Rear End	64	72.7%

Figure 4: Map of Crash Locations by Type

## 2.3 Lighting and Road Surface Conditions

The HSM indicates that crashes that take place during nighttime or on wet pavement may have design related contributing causes. **Table 10** summarizes the lighting, weather, and roadway surface conditions that were present at the time of the crashes. A review of this table indicators that a majority of the crashes occurred during daylight (73.2 percent), in clear or cloudy weather (88.1 percent), and on dry road (81.3 percent).

**Table 10: Crash Conditions Summary**

**Table 11** summarizes wet/slick/unpaved and standing water road surface conditions as well as crashes taking place in dark conditions with no lighting by location for all locations with at least 30 crashes. Of these locations, northbound I-75 at on-ramp from eastbound Colonial Boulevard has both the highest proportion of wet/slick/unpaved and standing water crashes (53 percent) and the highest proportion of crashes taking place in dark conditions with no lighting (7 percent). The method of consolidating road surface conditions and lighting conditions into the classifications shown in **Table 11** is included in **Appendix D**.

## 2.4 Crash Severity

**Table 12** summarizes crashes for the study area by severity. Of the 923 total crashes, there were four fatal crashes, 400 crashes involving personal injury, and 519 crashes that were property damage only. The FDOT KABCO crash costs from the FDOT Florida Design Manual 2020 edition are summarized in **Table 13**.

**Table 12: Crash Severity Summary**

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Fatal	0	0	1	2	1	4	0.8	0.4%
Severe Injury	3	2	4	3	3	15	3.0	1.6%
Moderate Injury	22	15	28	23	13	101	20.2	10.9%
Minor Injury	48	56	55	72	53	284	56.8	30.8%
Property Damage Only	111	75	121	109	103	519	103.8	56.2%
<b>Total</b>	<b>184</b>	<b>148</b>	<b>209</b>	<b>209</b>	<b>173</b>	<b>923</b>		<b>100.0%</b>

**Table 13: FDOT KABCO Crash Costs**

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$10,670,000
Severe Injury (A)	\$872,612
Moderate Injury (B)	\$174,018
Minor Injury (C)	\$106,215
Property Damage Only (O)	\$7,700

**Table 14**, **Table 15**, and **Table 16** summarize crash severity and comprehensive crash cost by location for arterial segments, intersections, and interstate segments, respectively. Locations without crashes are excluded from these tables. Overall, there were four fatal crashes, 15 severe injury crashes, 101 moderate injury crashes, 281 minor injury crashes, and 516 property damage only crashes. These crashes had an estimated comprehensive crash cost of \$107,506,358, which is an average of \$21,501,272 per year. **Figure 5** shows crashes by severity within the study area.

The average cost per crash at each location was calculated by dividing the total crash cost by the total crashes. This was then compared to the statewide average cost per crash based on the FDOT Average Crash Costs by Facility Type Table 122.6.1 from the FDOT Design Manual 2020.. These tables and the summary of the statewide average cost per crash are included in **Appendix D**. Overall, two locations had cost per crash higher than the statewide average. The actual location-specific average per crash of these locations is shown in red in the tables below. The location with the highest comprehensive crash cost was the intersection of Colonial Boulevard at Ortiz Avenue / Six Mile Cypress Parkway, with an estimated total five-year crash cost of \$40,363,962. The location with the highest average cost per crash was southbound I-75 at on-ramp from Colonial Boulevard, with an average cost per crash of \$391,641.

Table 14: Crash Severity – Arterial

Locations	Fatal	Severe Injury	Moderate Injury	Minor Injury	Property Damage Only	Total Crashes	Total Crash Cost	Location Average Cost Per Crash	State Average Cost Per Crash
Colonial Blvd Between Ortiz Ave and I-75 SB Ramp Terminal	0	3	8	30	47	88	\$7,558,330	\$85,890	\$166,258

WPI Segment No.: 442519-3

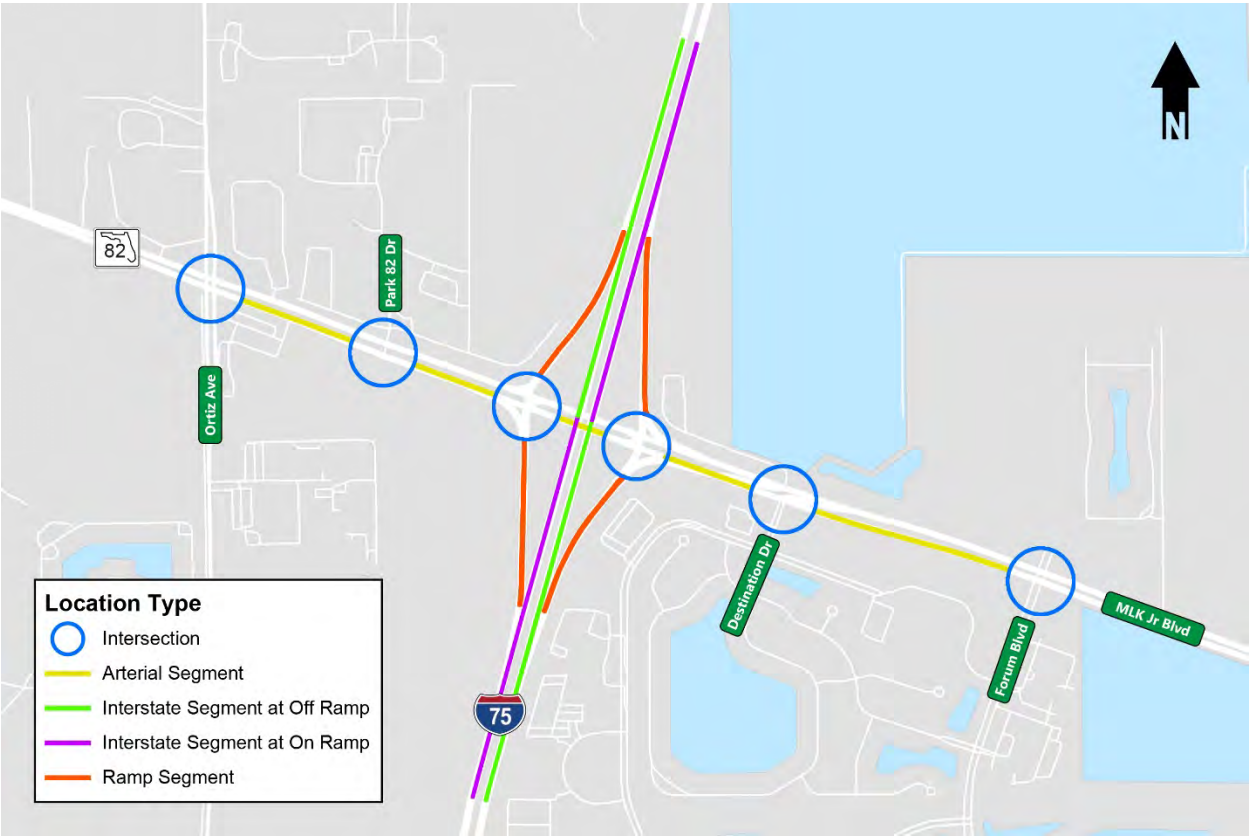

**Florida Department of Transportation**

**April 2021**

# 1.0 Historical Crash Data

The study area includes from Ortiz Avenue to Forum Boulevard and I-75 from south of Dr Martin Luther King Jr Boulevard to north of Dr Martin Luther King Jr Boulevard as well as the on- and off-ramps for the interchange. Crash data was obtained for the study area from FDOT's Crash Analysis Reporting (CAR) Online and the University of Florida's Signal Four (S4) crash database for the five-year analysis period from 2013 to 2017. **Figure 1** shows the division of the study area into intersection and segment locations. The intersection locations include a 250-foot influence area from the center of the intersection based on FDOT's spot location crash rate calculations, and the segments on the arterial include the roadway between intersections. On the interstate, the mainline segments have been divided into one segment per ramp gore point. The off-ramp segments begin 1,500 feet upstream of the off-ramp gore points and extend to the halfway point between the off-ramp and on-ramp gore points. The on-ramp segments extend from that halfway point to 1,500 feet downstream of the on-ramp gore points.

Figure 1: Study Area Locations

**Table 1** summarizes the number of crashes, vehicles, fatalities, and injuries that occurred during each of the analysis years. Roadways without any crashes are not included in this table. A total of 365 crashes involving 718 vehicles occurred during the analysis period resulting in two fatalities and 235 injuries. This crash data is included in **Appendix F**. A majority of crashes occurred at the intersections on Dr Martin Luther King Jr Boulevard, accounting for 241 crashes, 504 vehicles, two fatalities, and 172 injuries. Crash frequency has fluctuated year to year throughout the study area, providing no clear insight into trends.

## 2.0 Crash Analysis

### 2.1 Historical Crash Rates

The crash rate at each location was calculated using the Federal Highway Administration's (FHWA's) crash rate formula adapted for million vehicle miles traveled as follows<sup>1</sup>:

$$\text{Crash Rate} = \frac{1,000,000 * C}{365 * N * V * L}$$

Where

- C = Total number of crashes for the analysis period.
- N = Number of years in the analysis period.
- V = Average Annual Average Daily Traffic (AADT) per year on the roadway segment or entering the intersection during the analysis period.
- L = The length of the roadway segment when analyzing roadway segments, or 1 when analyzing intersections.

Each crash rate was then compared to the statewide average for that facility type using the procedure detailed in the FDOT CARS User Manual to determine the level of confidence that a location's crash rate is higher than the statewide average from the FDOT CARS database for 2013-2017 for a location's facility type (i.e., the high crash confidence). Locations that do not have statewide average crash rates associated with their facility type (e.g., ramp locations) have a statewide average crash rate and high crash confidence percentage listed as N/A.

**Table 2**, **Table 3**, and **Table 4** summarize the crash rates for the arterial segments, arterial intersections, and interstate segment locations respectively. A summary of the statewide average crash rates by facility type for facility types included in these tables can be seen in **Table 5**. The raw CAR output for five-year statewide average crash rates can be found in **Appendix D**. Four locations have a crash rate that is significantly higher than the statewide average, defined as a high crash confidence of 95 percent or higher, including the intersections on Dr Martin Luther King Jr Boulevard at Ortiz Avenue, both ramp terminals, and Forum Boulevard. Additionally, the four ramp segments connecting the interstate to the arterial do not have a statewide average crash rate associated with their facility type. **Figure 2** shows each location symbolized according to its high crash confidence. **Figure 3** shows a heat map of crashes for the study area. Crashes are primarily clustered at the Ortiz Avenue intersection.

---

<sup>1</sup> FHWA calculates crash rate in terms of 100 million vehicle-miles traveled. FDOT calculates crash rate in terms of million vehicle-miles traveled, so the constant is adjusted accordingly.

Table 2: Arterial Segment Crash Rates

Segment Location	Total Crashes	5-Year Average AADT	Segment Length (mi)	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*
Ortiz Ave to Park Eighty Two Dr	6	33,300	0.169	0.584	2.711	1.2	8.08%

Sideswipe	5	5	8	18	19	55	11.0	15.1%
Single Vehicle	3	3	4	8	2	20	4.0	5.5%
Unknown	0	0	0	0	0	0	0.0	0.0%
<b>Total</b>	<b>43</b>	<b>72</b>	<b>58</b>	<b>104</b>	<b>88</b>	<b>365</b>	<b>73.0</b>	<b>100.0%</b>

**Table 7**, **Table 8**, and **Table 9** summarize the most frequent crash type for arterial segments, arterial intersections, and interstate segments, respectively. If more than one crash type tied for the most common crash type, all the tied crash types were listed.

Rear end crashes were the most common on arterial segments and intersections. The Highway Safety Manual (HSM) indicates that possible contributing factors for rear end crashes include inappropriate approach speeds, poor visibility of signals, unexpected lane changes on approach, narrow lanes, unexpected stops on approach, slippery pavement, and excessive speed.

Both fixed object and sideswipe crashes were the most common on interstate segments. The HSM indicates that possible contributing factors for fixed object crashes include obstruction in or near roadway, inadequate lighting, inadequate pavement markings; inadequate signs, delineators, guardrail; slippery pavement; roadside design (e.g., inadequate clear distance), inadequate roadway geometry; and excessive speed. The HSM does not provide contributing causes for sideswipe crashes on roadway segments. However, applicable contributing factors may include unexpected lane changes, narrow lanes, slippery pavement, inadequate pavement markings, and excessive speed.

**Figure 4** shows a map of crash locations by crash type. Any head-on, bicycle, and pedestrian crashes have been depicted with a star to emphasize crashes that are generally serious in nature. Crash types without any associated crashes are not listed in the legend.

Table 7: Arterial Segment Crash Types

Figure 4: Map of Crash Locations by Type

## 2.3 Lighting and Road Surface Conditions

The HSM indicates that crashes that take place during nighttime or on wet pavement may have design related contributing causes. **Table 10** summarizes the lighting, weather, and roadway surface conditions that were present at the time of the crashes. A review of this table indicators that a majority of the crashes occurred during daylight (76.7%), in clear or cloudy weather (89.9%), and in dry road surface conditions (86.6%).

**Table 10: Crash Conditions Summary**

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage

**Table 11** summarizes wet/slick/unpaved and standing water road surface conditions as well as crashes taking place in dark conditions with no lighting by location for all locations with at least 30 crashes. Of these locations, Dr Martin Luther King Jr Boulevard at I-75 southbound ramps has the highest proportion of wet/slick/unpaved and standing water crashes at 13 percent, and Dr Martin Luther King Jr Boulevard at Ortiz Avenue has the highest proportion of crashes taking place in dark conditions with no lighting at 8 percent. The method of consolidating road surface conditions and lighting conditions into the classifications shown in **Table 11** is included in **Appendix F**.

## 2.4 Crash Severity

**Table 12** summarizes crashes for the study area by severity. Of the 366 total crashes, there were two fatal crashes, 146 crashes involving personal injury, and 217 crashes that were property damage only. The FDOT KABCO crash costs from the FDOT Florida Design Manual 2020 edition are summarized in **Table 13**.

**Table 12: Crash Severity Summary**

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Fatal	0	1	0	1	0	2	0.4	0.5%
Severe Injury	1	1	3	4	0	9	1.8	2.5%
Moderate Injury	2	11	9	12	6	40	8.0	11.0%
Minor Injury	10	16	17	31	23	97	19.4	26.6%
Property Damage Only	30	43	29	56	59	217	43.4	59.5%
<b>Total</b>	<b>43</b>	<b>72</b>	<b>58</b>	<b>104</b>	<b>88</b>	<b>365</b>		<b>100.0%</b>

**Table 13: FDOT KABCO Crash Costs**

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$10,670,000
Severe Injury (A)	\$872,612
Moderate Injury (B)	\$174,018
Minor Injury (C)	\$106,215
Property Damage Only (O)	\$7,700

**Table 14**, **Table 15**, and **Table 16** summarize crash severity and comprehensive crash cost by location for arterial segments, intersections, and interstate segments, respectively. Locations without crashes are excluded from these tables. Overall, there were two fatal crashes, nine severe injury crashes, 40 moderate injury crashes, 97 minor injury crashes, and 217 property damage only crashes. These crashes had an estimated comprehensive crash cost of \$48,127,983, which is an average of \$9,625,597 per year. **Figure 5** shows crashes by severity within the study area.

The average cost per crash at each location was calculated by dividing the total crash cost by the total crashes. This was then compared to the statewide average cost per crash based on the FDOT Average Crash Costs by Facility Type Table 122.6.1 from the FDOT Design Manual 2020.. These tables and the summary of the statewide average cost per crash are included in **Appendix F**. Overall, three locations had cost per crash higher than the statewide average. The location-specific average cost per crash of these locations is shown in red in the tables below. The location with the highest comprehensive crash cost was Dr Martin Luther King Jr Blvd at the I-75 southbound ramp terminal, with an estimated total five-year crash cost of \$13,765,867. The location with the highest average cost per crash was northbound I-75 at on-ramp from Palm Beach Boulevard, with an average cost per crash of \$408,223.

Table 14: Crash Severity – Arterial

Locations	Fatal	Severe Injury	Moderate Injury	Minor Injury	Property Damage Only	Total Crashes	Total Crash Cost	Location Average Cost Per Crash	State Average Cost Per Crash
Dr Martin Luther King Jr Blvd Between Ortiz Ave and Park Eighty Two Dr	0	0	0	3	3	6	\$341,745	\$56,958	\$166,258

## 1.0 Historical Crash Data

The study area includes Lockett Road from Livingston Road to Logan Boulevard and I-75 from south of Lockett Road to north of Lockett Road as well as the on- and off-ramps for the interchange. Crash data was obtained for the study area from FDOT's Crash Analysis Reporting (CAR) Online and the University of Florida's Signal Four (S4) crash database for the five-year analysis period from 2013 to 2017. **Figure 1** shows the division of the study area into intersection and segment locations. The intersection locations include a 250-foot influence area from the center of the intersection based on FDOT's spot location crash rate calculations, and the segments on the arterial include the roadway between intersections. On the interstate, the mainline segments have been divided into one segment per ramp gore point. The off-ramp segments begin 1,500 feet upstream of the off-ramp gore points and extend to the halfway point between the off-ramp and on-ramp gore points. The on-ramp segments extend from that halfway point to 1,500 feet downstream of the on-ramp gore points.

Figure 1: Study Area Locations

**Table 1** summarizes the number of crashes, vehicles, fatalities, and injuries that occurred during each of the analysis years. Roadways without any crashes are not included in this table. A total of 90 crashes involving 162 vehicles occurred during the analysis period resulting in zero fatalities and 56 injuries. This crash data is included in **Appendix F**. I-75 accounted for 79 of the 90 crashes, with crashes on northbound I-75 increasing from 2015 through 2017 and fluctuating on southbound I-75. Other locations have decreasing or constant crash frequencies.

Table 1: Crash History by Roadway and Year

## 2.0 Crash Analysis

### 2.1 Historical Crash Rates

The crash rate at each location was calculated using the Federal Highway Administration's (FHWA's) crash rate formula adapted for million vehicle miles traveled as follows<sup>1</sup>:

$$\text{Crash Rate} = \frac{1,000,000 * C}{365 * N * V * L}$$

Where

- C = Total number of crashes for the analysis period.
- N = Number of years in the analysis period.
- V = Average Annual Average Daily Traffic (AADT) per year on the roadway segment or entering the intersection during the analysis period.
- L = The length of the roadway segment when analyzing roadway segments, or 1 when analyzing intersections.

Each crash rate was then compared to the statewide average for that facility type using the procedure detailed in the FDOT CARS User Manual to determine the level of confidence that a location's crash rate is higher than the statewide average from the FDOT CARS database for 2013-2017 for a location's facility type (i.e., the high crash confidence). Locations that do not have statewide average crash rates associated with their facility type (e.g., ramp locations) have a statewide average crash rate and high crash confidence percentage listed as N/A.

**Table 2**, **Table 3**, and **Table 4** summarize the crash rates for the arterial segments, arterial intersections, and interstate segment locations respectively. A summary of the statewide average crash rates by facility type for facility types included in these tables can be seen in **Table 5**. The raw CAR output for five-year statewide average crash rates can be found in **Appendix D**. No locations have a crash rate that is significantly higher than the statewide average, defined as a high crash confidence of 95 percent or higher. Additionally, the four ramp segments connecting the interstate to the arterial do not have a statewide average crash rate associated with their facility type. **Figure 2** shows each location symbolized according to its high crash confidence. **Figure 3** shows a heat map of crashes for the study area. Crash clusters can be seen just to the south and north of the northbound off-ramp gore point, as well as at Corporation Circle / Hamilton Drive.

---

<sup>1</sup> FHWA calculates crash rate in terms of 100 million vehicle-miles traveled. FDOT calculates crash rate in terms of million vehicle-miles traveled, so the constant is adjusted accordingly.

Table 2: Arterial Segment Crash Rates

Segment Location	Total Crashes	5-Year Average AADT	Segment Length (mi)	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*

**Table 7**, **Table 8**, and **Table 9** summarize the most frequent crash type for arterial segments, arterial intersections, and interstate segments, respectively. If more than one crash type tied for the most common crash type, all the tied crash types were listed.

Left turn crashes were the most common at intersection locations. The Highway Safety Manual (HSM) indicates that possible contributing factors for left turn crashes include misjudging speed of on-coming traffic, pedestrian or bicycle conflicts, inadequate signal timing, inadequate sight distance, left- or right-turn movement, conflict with right-turn-on-red vehicles, and inadequate gaps in traffic.

Rear end crashes were the most common on interstate segment locations. Relevant contributing factors from the HSM include slippery pavement, excessive speed, driver inattention, unexpected stops, and unexpected lane changes.

**Figure 4** shows a map of crash locations by crash type. Any head-on, bicycle, and pedestrian crashes have been depicted with a star to emphasize crashes that are generally serious in nature. Crash types without any associated crashes are not listed in the legend.

### 2.3 Lighting and Road Surface Conditions

The HSM indicates that crashes that take place during nighttime or on wet pavement may have design related contributing causes. **Table 10** summarizes the lighting, weather, and roadway surface conditions that were present at the time of the crashes. A review of this table indicates that a majority of the crashes occurred during daylight (70%), clear or cloudy weather (85.5%), and on dry road (79.8%).

Table 10: Crash Conditions Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage

**Table 11** summarizes wet/slick/unpaved and standing water road surface conditions as well as crashes taking place in dark conditions with no lighting by location for all locations with at least 30 crashes. Only one location has at least 30 crashes. This location is northbound I-75 at off-ramp to Luccett Road, with a proportion of wet/slick/unpaved and standing water crashes at 30 percent and a proportion of crashes taking place in dark conditions with no lighting at 18 percent. The method of consolidating road surface conditions and lighting conditions into the classifications shown in **Table 11** is included in **Appendix F**.

Table 11: Crash Cause Summary

NB I-75 At Off-Ramp to Lockett Rd	40	11	1	30%	7	18%

## 2.4 Crash Severity

**Table 12** summarizes crashes for the study area by severity. Of the 90 total crashes, there were zero fatal crashes, 29 crashes involving personal injury, and 61 crashes that were property damage only. The FDOT KABCO crash costs from the FDOT Florida Design Manual 2020 edition are summarized in **Table 11**.

Table 12: Crash Severity Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Fatal	0	0	0	0	0	0	0.0	0.0%
Severe Injury	0	1	0	0	1	2	0.4	2.2%
Moderate Injury	2	3	2	4	4	15	3.0	16.7%
Minor Injury	5	2	2	1	2	12	2.4	13.3%
Property Damage Only	23	8	7	11	12	61	12.2	67.8%
<b>Total</b>	<b>30</b>	<b>14</b>	<b>11</b>	<b>16</b>	<b>19</b>	<b>90</b>		<b>100.0%</b>

Table 13: FDOT KABCO Crash Costs

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$10,670,000
Severe Injury (A)	\$872,612
Moderate Injury (B)	\$174,018
Minor Injury (C)	\$106,215
Property Damage Only (O)	\$7,700

**Table 14**, **Table 15**, and **Table 16** summarize crash severity and comprehensive crash cost by location for arterial segments, intersections, and interstate segments, respectively. Locations without crashes are excluded from these tables. Overall, there were zero fatal crashes, two severe injury crashes, 15 moderate injury crashes, 12 minor injury crashes, and 61 property damage only crashes. These crashes had an estimated comprehensive crash cost of \$6,099,774, which is an average of \$4,919,152 per year. **Figure 5** shows crashes by severity within the study area.

The average cost per crash at each location was calculated by dividing the total crash cost by the total crashes. This was then compared to the statewide average cost per crash based on the FDOT Average Crash Costs by Facility Type Table 122.6.1 from the FDOT Design Manual 2020.. These tables and the summary of the statewide average cost per crash are included in **Appendix F**. Overall, zero locations had cost per crash higher than the statewide average. The location with the highest comprehensive crash cost was I-75 at the off-ramp to Lockett Rd, with an estimated total five-year crash cost of \$2,829,713. The location with the highest average cost per crash was northbound I-75 at on-ramp from Lockett Road, with an average cost per crash of \$408,223.

Table 14: Crash Severity – Arterial

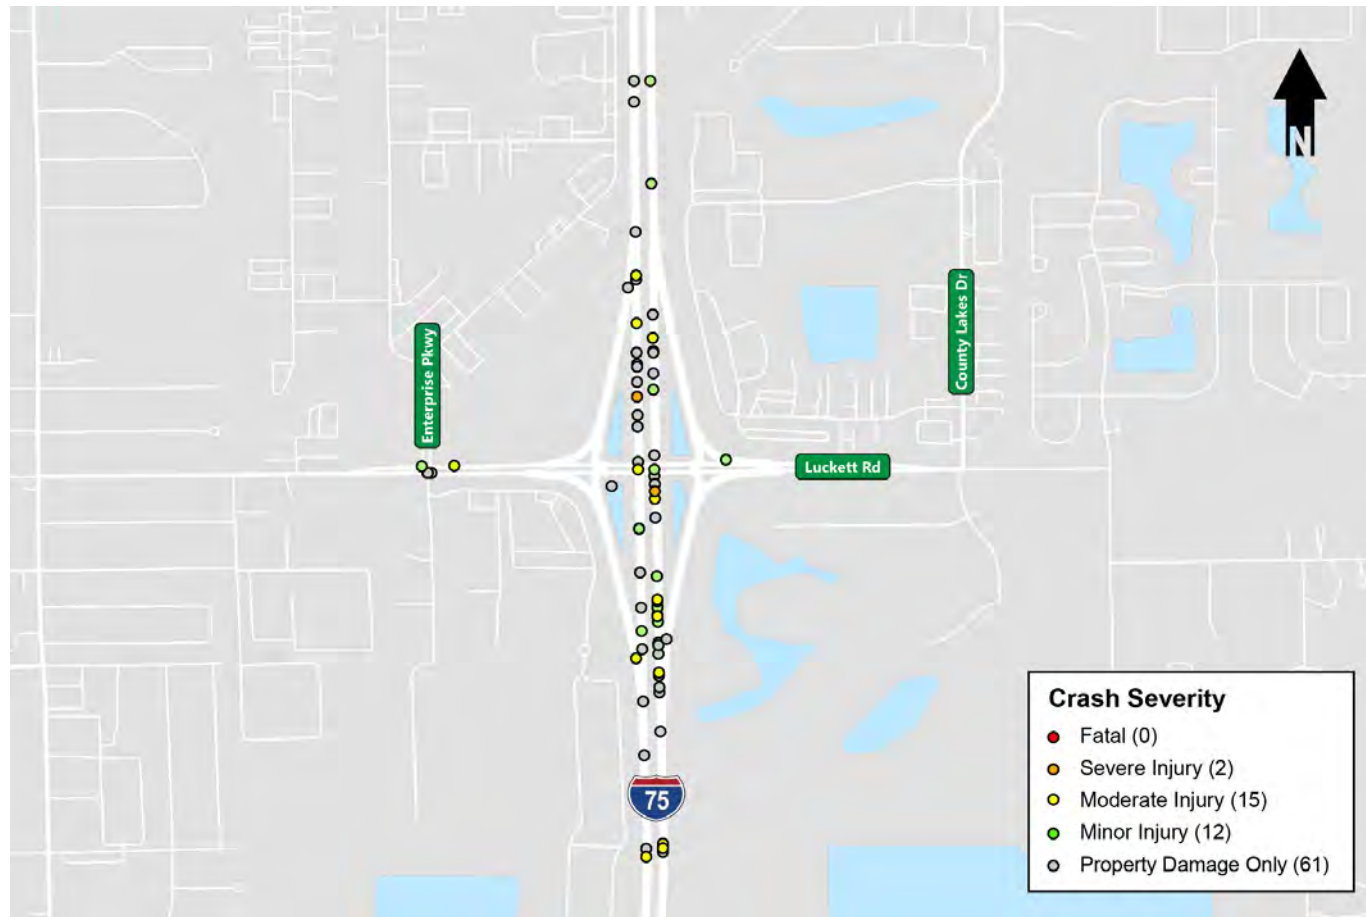

There are no crashes on the arterial segments.

Table 15: Crash Severity – Intersection

Locations	Fatal	Severe Injury	Moderate Injury	Minor Injury	Property Damage Only	Total Crashes	Total Crash Cost	Location Average Cost Per Crash	State Average Cost Per Crash
Luckett Rd at Corporation Cir/Hamilton Dr	0	0	1	1	4	6	\$311,033	\$51,839	\$123,406
Luckett Rd at I-75 SB Ramp Terminals (Unsignalized)	0	0	0	0	1	1	\$7,700	\$7,700	\$159,093
Luckett Rd at I-75 NB Ramp Terminals (Unsignalized)	0	0	0	1	0	1	\$106,215	\$106,215	\$159,093
<b>Total</b>	<b>0</b>	<b>0</b>	<b>1</b>	<b>2</b>	<b>5</b>	<b>8</b>	<b>\$424,948</b>	<b>\$53,119</b>	

Figure 5: Map of Crash Locations by Severity

## 2.5 Contributing Causes

A summary of crashes by driver contributing cause for the high crash locations is shown in **Table 17**. Among the contributing causes documented in the crash data, careless/negligent driving (38 crashes, 42.2 percent) and no contributing action (25 crashes, 27.8 percent) were among the highest.

Table 17: Contributing Causes Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage

*DRAFT*

**SAFETY MEMORANDUM**

**I-75 at Palm Beach Boulevard**

WPI Segment No.: 442519-3

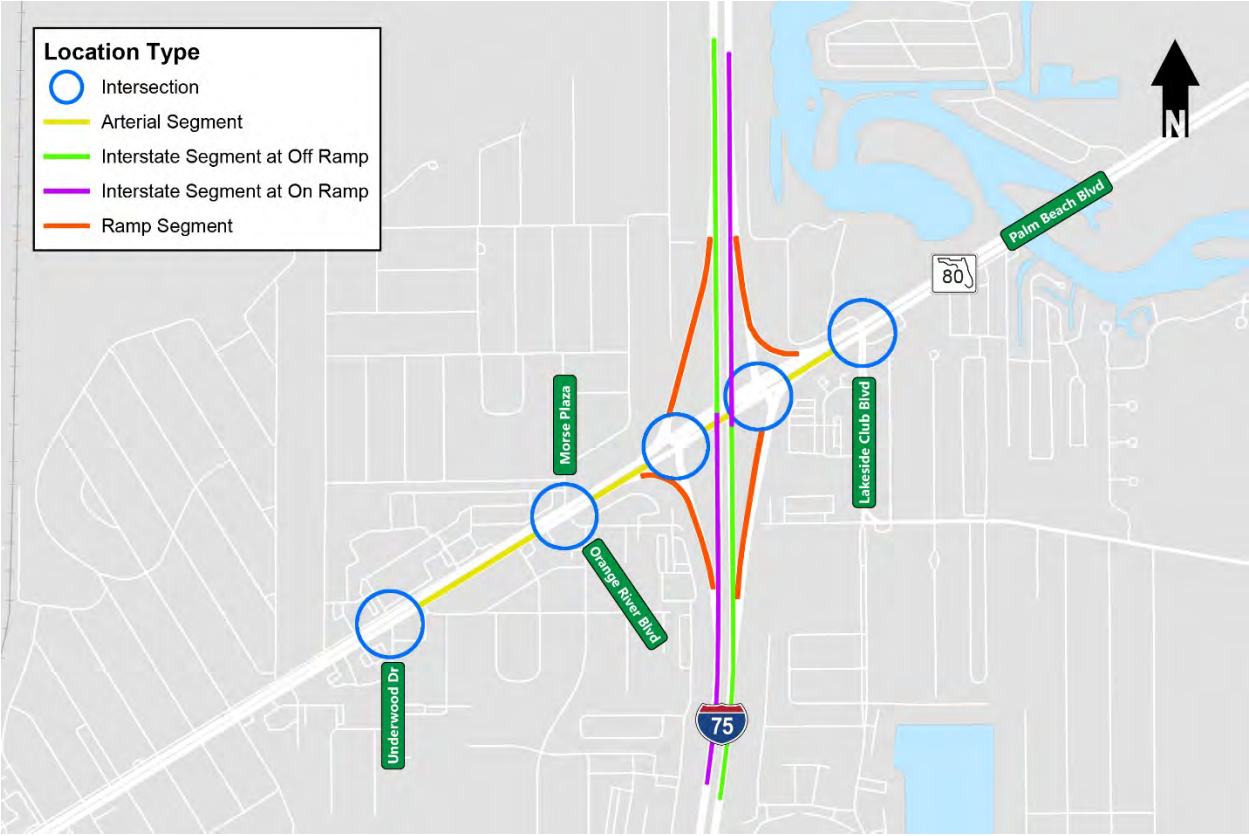

**Florida Department of Transportation**

**April 2021**

# 1.0 Historical Crash Data

The study area includes Palm Beach Boulevard from Underwood Drive to Orange River Boulevard/Louise Street and I-75 from south of Palm Beach Drive to north of Palm Beach Drive as well as the on- and off-ramps for the interchange. Crash data was obtained for the study area from FDOT's Crash Analysis Reporting (CAR) Online and the University of Florida's Signal Four (S4) crash database for the five-year analysis period from 2013 to 2017. Figure 1 shows the division of the study area into intersection and segment locations. The intersection locations include a 250-foot influence area from the center of the intersection based on FDOT's spot location crash rate calculations, and the segments on the arterial include the roadway between intersections. On the interstate, the mainline segments have been divided into one segment per ramp gore point. The off-ramp segments begin 1,500 feet upstream of the off-ramp gore points and extend to the halfway point between the off-ramp and on-ramp gore points. The on-ramp segments extend from that halfway point to 1,500 feet downstream of the on-ramp gore points.

Figure 1: Study Area Locations

**Table 1** summarizes the number of crashes, vehicles, fatalities, and injuries that occurred during each of the analysis years. Roadways without any crashes are not included in this table. A total of 330 crashes involving 632 vehicles occurred during the analysis period resulting in three fatalities and 198 injuries. This crash data is included in **Appendix F**. More than half of the crashes occurred at the intersections on Palm Beach Boulevard, accounting for 164 crashes, 339 vehicles, two fatalities, and 98 injuries. Crashes on Palm Beach Boulevard have declined since 2015, while other locations show relatively constant crash frequency in recent years.

## 2.0 Crash Analysis

### 2.1 Historical Crash Rates

The crash rate at each location was calculated using the Federal Highway Administration's (FHWA's) crash rate formula adapted for million vehicle miles traveled as follows<sup>1</sup>:

$$\text{Crash Rate} = \frac{1,000,000 * C}{365 * N * V * L}$$

Where

- C = Total number of crashes for the analysis period.
- N = Number of years in the analysis period.
- V = Average Annual Average Daily Traffic (AADT) per year on the roadway segment or entering the intersection during the analysis period.
- L = The length of the roadway segment when analyzing roadway segments, or 1 when analyzing intersections.

Each crash rate was then compared to the statewide average for that facility type using the procedure detailed in the FDOT CARS User Manual to determine the level of confidence that a location's crash rate is higher than the statewide average from the FDOT CARS database for 2013-2017 for a location's facility type (i.e., the high crash confidence). Locations that do not have statewide average crash rates associated with their facility type (e.g., ramp locations) have a statewide average crash rate and high crash confidence percentage listed as N/A.

**Table 2**, **Table 3**, and **Table 4** summarize the crash rates for the arterial segments, arterial intersections, and interstate segment locations, respectively. A summary of the statewide average crash rates by facility type for facility types included in these tables can be seen in **Table 5**. The raw CAR output for five-year statewide average crash rates can be found in **Appendix D**. Two locations have a crash rate that is significantly higher than the statewide average, defined as a high crash confidence of 95 percent or higher, including the I-75 northbound ramp terminal intersection and northbound I-75 at the on-ramp from Palm Beach Boulevard. Additionally, the four ramp segments connecting the interstate to the arterial do not have a statewide average crash rate associated with their facility type. **Figure 2** shows each location symbolized according to its high crash confidence. **Figure 3** shows a heat map of crashes for the study area. Crashes tend to cluster around the study area intersections, but the densest clusters are at the Orange River Boulevard/Louise Street intersection and the I-75 northbound ramp terminal intersection.

---

<sup>1</sup> FHWA calculates crash rate in terms of 100 million vehicle-miles traveled. FDOT calculates crash rate in terms of million vehicle-miles traveled, so the constant is adjusted accordingly.

Table 2: Arterial Segment Crash Rates

Segment Location	Total Crashes	5-Year Average AADT	Segment Length (mi)	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*

Unknown	2	0	0	0	0	2	0.4	0.6%
<b>Total</b>	<b>61</b>	<b>54</b>	<b>84</b>	<b>69</b>	<b>62</b>	<b>330</b>	<b>66.0</b>	<b>100.0%</b>

**Table 7**, **Table 8**, and **Table 9** summarize the most frequent crash type for arterial segments, arterial intersections, and interstate segments, respectively. If more than one crash type tied for the most common crash type, all the tied crash types were listed.

Rear end crashes were the most common on arterial segments and intersections. The Highway Safety Manual (HSM) indicates that possible contributing factors for rear end crashes include inappropriate approach speeds, poor visibility of signals, unexpected lane changes on approach, narrow lanes, unexpected stops on approach, slippery pavement, and excessive speed.

Hit fixed object crashes were the most common on interstate segments. The Highway Safety Manual (HSM) indicates that possible contributing factors for hit fixed object crashes include obstruction in or near roadway, inadequate lighting, inadequate pavement markings; inadequate signs, delineators, guardrail; slippery pavement; roadside design (e.g., inadequate clear distance), inadequate roadway geometry; and excessive speed.

**Figure 4** shows a map of crash locations by crash type. Any head-on, bicycle, and pedestrian crashes have been depicted with a star to emphasize crashes that are generally serious in nature. Crash types without any associated crashes are not listed in the legend.

Table 7: Arterial Segment Crash Types

Location	Most Common Crash Type	Total of Crash Type	% of Location Total
Underwood Dr to Morse Plz / Orange River Blvd	Rear End Sideswipe	1	50.0%
Morse Plz / Orange River Blvd to I-75 SB Ramp Terminal	Head On Left Turn	3	23.1%
I-75 SB to NB Ramp Terminal	Rear End	7	63.6%

## 2.3 Lighting and Road Surface Conditions

The HSM indicates that crashes that take place during nighttime or on wet pavement may have design related contributing causes. **Table 10** summarizes the lighting, weather, and roadway surface conditions that were present at the time of the crashes. A review of this table indicators that a majority of the crashes occurred during daylight (79.1 percent), in clear or cloudy conditions (79.1 percent), and on dry roadways (74.2 percent).

**Table 10: Crash Conditions Summary**

**Table 11** summarizes wet/slick/unpaved and standing water road surface conditions as well as crashes taking place in dark conditions with no lighting by location for all locations with at least 30 crashes. Of these locations, northbound I-75 at on-ramp from Palm Beach Boulevard has the highest proportion of wet/slick/unpaved and standing water crashes at 68 percent, and northbound I-75 at off-ramp to Palm Beach Boulevard has the highest proportion of crashes taking place in dark conditions with no lighting at 17 percent. The method of consolidating road surface conditions and lighting conditions into the classifications shown in **Table 11** is included in **Appendix F**.

## 2.4 Crash Severity

**Table 12** summarizes crashes for the study area by severity. Of the 330 total crashes, there were three fatal crashes, 113 crashes involving personal injury, and 214 crashes that were property damage only. The FDOT KABCO crash costs from the FDOT Florida Design Manual 2020 edition are summarized in **Table 13**.

**Table 12: Crash Severity Summary**

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Fatal	0	0	1	1	1	3	0.6	0.9%
Severe Injury	3	0	2	3	6	14	2.8	4.2%
Moderate Injury	6	7	15	13	8	49	9.8	14.8%
Minor Injury	12	8	11	10	9	50	10.0	15.2%
Property Damage Only	40	39	55	42	38	214	42.8	64.8%
<b>Total</b>	<b>61</b>	<b>54</b>	<b>84</b>	<b>69</b>	<b>62</b>	<b>330</b>		<b>100.0%</b>

**Table 13: FDOT KABCO Crash Costs**

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$10,670,000
Severe Injury (A)	\$872,612
Moderate Injury (B)	\$174,018
Minor Injury (C)	\$106,215
Property Damage Only (O)	\$7,700

**Table 14**, **Table 15**, and **Table 16** summarize crash severity and comprehensive crash cost by location for arterial segments, intersections, and interstate segments, respectively. Locations without crashes are excluded from these tables. Overall, there were three fatal crashes, 14 severe injury crashes, 49 moderate injury crashes, 50 minor injury crashes, and 214 property damage only crashes. These crashes had an estimated comprehensive crash cost of \$59,712,000, which is an average of \$11,942,400 per year. **Figure 5** shows crashes by severity within the study area.

The average cost per crash at each location was calculated by dividing the total crash cost by the total crashes. This was then compared to the statewide average cost per crash based on the FDOT Average Crash Costs by Facility Type Table 122.6.1 from the FDOT Design Manual 2020.. These tables and the summary of the statewide average cost per crash are included in **Appendix F**. Overall, two locations had cost per crash higher than the statewide average. The location-specific average cost per crash of these locations is shown in red in the tables below. The location with the highest comprehensive crash cost was the I-75 northbound ramp terminal intersection, with an estimated total five-year crash cost of \$16,466,994. The location with the highest average cost per crash was Palm Beach Boulevard at I-75 southbound ramps, with an average cost per crash of \$502,253.

Table 14: Crash Severity – Arterial

*DRAFT*

**SAFETY MEMORANDUM**

**Bayshore Road at I-75**

WPI Segment No.: 442519-3

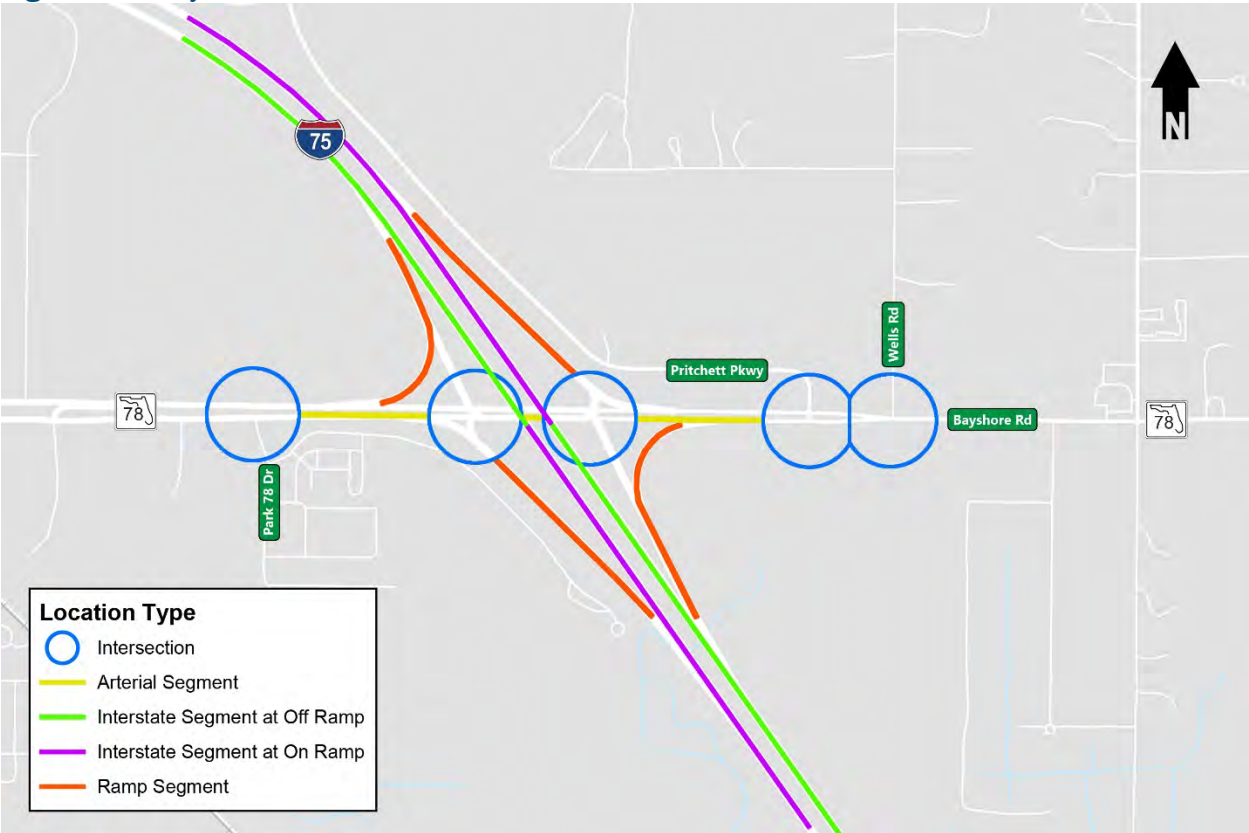

**Florida Department of Transportation**

**April 2021**

# 1.0 Historical Crash Data

The study area includes Bayshore Road from Park Seventy Eight Drive to Wells Road and I-75 from south of Bayshore Road to north of Bayshore Road as well as the on- and off-ramps for the interchange. Crash data was obtained for the study area from FDOT’s Crash Analysis Reporting (CAR) Online and the University of Florida’s Signal Four (S4) crash database for the five-year analysis period from 2013 to 2017. **Figure 1** shows the division of the study area into intersection and segment locations. The intersection locations include a 250-foot influence area from the center of the intersection based on FDOT’s spot location crash rate calculations, and the segments on the arterial include the roadway between intersections. On the interstate, the mainline segments have been divided into one segment per ramp gore point. The off-ramp segments begin 1,500 feet upstream of the off-ramp gore points and extend to the halfway point between the off-ramp and on-ramp gore points. The on-ramp segments extend from that halfway point to 1,500 feet downstream of the on-ramp gore points.

Figure 1: Study Area Locations

**Table 1** summarizes the number of crashes, vehicles, fatalities, and injuries that occurred during each of the analysis years. Roadways without any crashes are not included in this table. A total of 223 crashes involving 408 vehicles occurred during the analysis period resulting in one fatality and 93 injuries. This crash data is included in **Appendix F**. Crashes were split closely between Bayshore Road and the I-75 segments, with 101 crashes on Bayshore Road compared to 122 on the various I-75 segments.

Table 1: Crash History by Roadway and Year

2013	1	2	0	0
2014	0	0	0	0
2015	2	7	0	0
2016	4	8	0	2
2017	4	6	0	1
Total	11	23	0	3
<b>Study Area Total</b>	<b>223</b>	<b>408</b>	<b>1</b>	<b>93</b>

Crash frequency along Bayshore Road increased between 2015 and 2016 and remained elevated above the crash frequency from 2013 through 2015. Similarly, southbound I-75 experienced an increase in crash frequency from 2013 through 2016, although this dropped in 2017. Northbound I-75 also saw a spike in crash frequency during 2015 and a low crash frequency in 2013. Other locations show a constant or decreasing crash frequency.

## 2.0 Crash Analysis

### 2.1 Historical Crash Rates

The crash rate at each location was calculated using the Federal Highway Administration's (FHWA's) crash rate formula adapted for million vehicle miles traveled as follows<sup>1</sup>:

$$\text{Crash Rate} = \frac{1,000,000 * C}{365 * N * V * L}$$

Where

- C = Total number of crashes for the analysis period.
- N = Number of years in the analysis period.
- V = Average Annual Average Daily Traffic (AADT) per year on the roadway segment or entering the intersection during the analysis period.
- L = The length of the roadway segment when analyzing roadway segments, or 1 when analyzing intersections.

Each crash rate was then compared to the statewide average for that facility type using the procedure detailed in the FDOT CARS User Manual to determine the level of confidence that a location's crash rate is higher than the statewide average from the FDOT CARS database for 2013-2017 for a location's facility type (i.e., the high crash confidence). Locations that do not have statewide average crash rates associated with their facility type (e.g., ramp locations) have a statewide average crash rate and high crash confidence percentage listed as N/A.

**Table 2**, **Table 3**, and **Table 4** summarize the crash rates for the arterial segments, arterial intersections, and interstate segment locations respectively. A summary of the statewide average crash rates by facility type for facility types included in these tables can be seen in **Table 5**. The raw CAR output for five-year statewide average crash rates can be found in **Appendix D**. Four locations have a crash rate that is significantly higher than the statewide average, defined as a high crash confidence of 95 percent or higher, which include both ramp terminal intersections as well as both the northbound and southbound I-75 mainline segments located at the off-ramps. Additionally, the four ramp segments connecting the interstate to the arterial do not have a statewide average crash rate associated with their facility type. **Figure 2** shows each location symbolized according to its high crash confidence. **Figure 3** shows a heat map of crashes for the study area. The areas of highest crash frequency are at Park Seventy Eight Dr., the southbound ramp terminal, and the northbound ramp terminal (especially the right turn at the northbound off-ramp).

---

<sup>1</sup> FHWA calculates crash rate in terms of 100 million vehicle-miles traveled. FDOT calculates crash rate in terms of million vehicle-miles traveled, so the constant is adjusted accordingly.

Table 2: Arterial Segment Crash Rates

Segment Location	Total Crashes	5-Year Average AADT	Segment Length (mi)	Actual Crash Rate	Statewide Average Crash Rate	Crashes Per Year	High Crash Confidence*
Park Seventy Eight Blvd to I-75 SB Ramp Terminal	6	23,000	0.132	1.083	3.634	1.2	11.18%

**Table 7**, **Table 8**, and **Table 9** summarize the most frequent crash type for arterial segments, arterial intersections, and interstate segments, respectively. If more than one crash type tied for the most common crash type, all the tied crash types were listed. Rear end crashes were the most common on arterial segments, arterial intersections, and interstate segments. The Highway Safety Manual (HSM) indicates that possible contributing factors for rear end crashes include inappropriate approach speeds, poor visibility of signals, unexpected lane changes on approach, narrow lanes, unexpected stops on approach, slippery pavement, excessive speeds, and restricted sight distance. **Figure 4** shows a map of crash locations by crash type. Any head-on, bicycle, and pedestrian crashes have been depicted with a star to emphasize crashes that are generally serious in nature. Crash types without any associated crashes are not listed in the legend.

Table 7: Arterial Segment Crash Types

Location	Most Common Crash Type	Total of Crash Type	% of Location Total

Figure 4: Map of Crash Locations by Type

## 2.3 Lighting and Road Surface Conditions

The HSM indicates that crashes that take place during nighttime or on wet pavement may have design related contributing causes. **Table 10** summarizes the lighting, weather, and roadway surface conditions that were present at the time of the crashes. A review of this table indicators that a majority of the crashes occurred during daylight (79.8 percent), in non-rainy conditions (77.6 percent), and on dry road (70.9 percent).

Table 10: Crash Conditions Summary

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage

**Table 11** summarizes wet/slick/unpaved and standing water road surface conditions as well as crashes taking place in dark conditions with no lighting by location for all locations with at least 30 crashes. Of these locations, southbound I-75 at on-ramp from Bayshore Road has the highest proportion of wet/slick/unpaved and standing water crashes at 52 percent, and northbound I-75 at off-ramp to Bayshore Road has the highest proportion of crashes taking place in dark conditions with no lighting at 14 percent. The method of consolidating road surface conditions and lighting conditions into the classifications shown in **Table 11** is included in **Appendix D**.

## 2.4 Crash Severity

**Table 12** summarizes crashes for the study area by severity. Of the 223 total crashes, there were 61 crashes involving personal injury, 161 crashes that were property damage only, and one fatal crash. The FDOT KABCO crash costs from the FDOT Florida Design Manual 2020 edition are summarized in **Table 13**.

**Table 12: Crash Severity Summary**

Category	2013	2014	2015	2016	2017	Total	Mean	Percentage
Fatal	0	0	1	0	0	1	0.2	0.5%
Severe Injury	0	2	2	4	1	9	1.8	4.1%
Moderate Injury	2	3	4	4	6	19	3.8	8.6%
Minor Injury	4	2	7	11	9	33	6.6	14.9%
Property Damage Only	18	26	36	43	37	160	32.2	72.1%
<b>Total</b>	<b>24</b>	<b>33</b>	<b>50</b>	<b>62</b>	<b>53</b>	<b>223</b>		<b>100.0%</b>

**Table 13: FDOT KABCO Crash Costs**

Crash Severity	Comprehensive Crash Cost
Fatal (K)	\$10,670,000
Severe Injury (A)	\$872,612
Moderate Injury (B)	\$174,018
Minor Injury (C)	\$106,215
Property Damage Only (O)	\$7,700

**Table 14**, **Table 15**, and **Table 16** summarize crash severity and comprehensive crash cost by location for arterial segments, intersections, and interstate segments, respectively. Locations without crashes are excluded from these tables. Overall, there were nine severe injury crashes, 19 moderate injury crashes, 33 minor injury crashes, 161 property damage only crashes, and one fatal crash. These crashes had an estimated comprehensive crash cost of \$26,574,645, which is an average of \$5,314,929 per year. **Figure 5** shows crashes by severity within the study area.

The average cost per crash at each location was calculated by dividing the total crash cost by the total crashes. This was then compared to the statewide average cost per crash based on the FDOT Average Crash Costs by Facility Type Table 122.6.1 from the FDOT Design Manual 2020.. These tables and the summary of the statewide average cost per crash are included in **Appendix D**. Overall, three locations had cost per crash higher than the statewide average. The location-specific average cost per crash of these locations is shown in red in the tables below. The location with the highest comprehensive crash cost was the Northbound I-75 segment at the off-ramp to Bayshore Rd, with an estimated total five-year crash cost of \$11,636,805. The location with the highest average cost per crash was northbound I-75 at off-ramp to Bayshore Road, with an average cost per crash of \$314,508.

Table 14: Crash Severity – Arterial

Locations	Fatal	Severe Injury	Moderate Injury	Minor Injury	Property Damage Only	Total Crashes	Total Crash Cost	Location Average Cost Per Crash	State Average Cost Per Crash
Park Seventy Eight Blvd to I-75 SB Ramp Terminal	0	1	0	1	4	6	\$1,009,627	\$168,271	\$123,406

## How to Ride

¿Como Usarlo?

- LeeTran’s bus routes are numbered and shown on the map in different colors.
- Locate on the map your starting point, your destination and the bus route(s) closest to them.
- Choose the appropriate bus schedule, showing departure times from major landmarks.
- Decide when you want to arrive at your destination, then work backward to determine when you need to catch the bus.
- Locate a LeeTran bus stop sign on the same side of the road as the direction in which you want to travel. Stand near the sign, so the driver knows that you want to catch the bus.
- Arrive at your bus stop at least five minutes before your departure time.
- Have your fare or pass ready, and enter the bus at the front door.
- If you have difficulty stepping on or off the bus, ask the driver to make the bus “kneel” to curb level. All LeeTran buses and trolleys have wheelchair ramps or lifts, and tie-downs. The driver will assist you.
- If you are entitled to a reduced fare, please have your ID ready.
- Onboard, signal for the bus to stop either by pulling the cord or pressing the strip along the windows at least one block before your desired stop.
- Leave the bus by the rear door and do not cross in front of the bus after disembarking.
- Use LeeTran’s easy online TripPlanner to map your trip at [www.rideleetrans.com](http://www.rideleetrans.com).

- Las rutas de LeeTran están numeradas y se muestran en el mapa con diferentes colores.
- Localice en el mapa su punto de partida y su destinación y la ruta o rutas más cercanas a los lugares que usted vaya a ir.
- Elija el horario apropiado que enseñe las horas de salida para los lugares claves que le sirvan para orientarse y poder llegar a donde usted desee ir.
- Decida a que hora quiere llegar a su destino, luego revise el horario del autobús y determine cuando lo debe tomar.
- Localice una parada del autobús en el mismo lado de la calle, en la dirección en la que usted quiere ir.
- Llegue a la parada por lo menos cinco minutos antes de la hora de la salida.
- Tenga el dinero del pasaje listo y entre al autobús por la puerta de enfrente.
- Si usted tiene dificultad al entrar o salir del autobús, dígame al chofer que baje el autobús al nivel de la banqueta.
- Todos los autobuses y trolebuses de LeeTran tienen rampas para las sillas de ruedas o elevadores y amarres para las sillas. El chofer lo/la asistirá.
- Sí usted tiene un descuento o reducción en su pasaje, por favor tenga su identificación lista.
- Señale para que el chofer pare el autobús ya sea jalando el cordón o haciendo presión en la franja junto a la ventanilla por lo menos una cuadra antes de su parada.
- Por favor después de salir del autobús no camine enfrente del mismo.

## Help Everyone Enjoy the Ride

Ayude a Que Todo el Mundo Disfrute el Viaje

- Eating, drinking, smoking (including e-cigarettes), and profanity are prohibited.
- Electronic devices that could disturb others, such as radios, video games, or MP3 players must be used with headphones.
- Please reserve the front seats for elderly or disabled riders.
- Please do not block the aisles with packages, bags or strollers.
- No weapons, alcohol or illegal substances are permitted on the bus.
- Passengers must remain behind the yellow line while the bus is in motion.
- Shirts and shoes are required.

- Comer, beber, fumar y decir malas palabras está prohibido.
- Aparatos electrónicos que puedan molestar a otros, como radios, juegos de video, o MP3 deben de ser usados con audífonos.
- Por favor deje los asientos de enfrente libres para los pasajeros de mayor edad y aquellos que están incapacitados.
- Por favor no bloquee el pasillo del autobús con paquetes, bolsas o con carritos de los niños.
- No están permitidas las bebidas alcohólicas, substancias ilegales, ni armas en el autobús.
- Los pasajeros deben de permanecer detrás de la línea amarilla mientras el autobús este en movimiento.

## Bike ‘n’ Bus

Bicicletas en el Autobús

LeeTran invites you to take your bike along for the ride to work, school, or just for fun. Every bus is equipped with a bike rack on the front which accommodates up to two bikes. The racks are easy to use, and your bike rides free! Riders are responsible for loading and securing their bikes and unloading them from the racks.

LeeTran lo invita a llevar su bicicleta con usted en el viaje hacia el trabajo, hacia la escuela o para recreación. Cada autobús está equipado con sostenes para las bicicletas en el frente del mismo y puede llevar hasta dos bicicletas. ¡Los sostenes son muy fáciles de usar y su bicicleta va gratis! Los pasajeros son responsables en montar, desmontar, y asegurar sus bicicletas en los sostenes.

## Transit ID

Identificaciones de Transporte

LeeTran ID cards enable people 65 years of age or more, people with disabilities, and full-time students to ride at a reduced fare. Photo ID cards are made at the Rosa Parks Transportation Center, 2250 Widman Way, Fort Myers, at a one-time cost of \$1.00. Seniors must show proof of age; persons with disabilities must show medical certification; and students must show proof of enrollment.

Las tarjetas de identificación emitidas por LeeTran permiten personas de 65 años y más, personas con discapacidades, y estudiantes pagar una tarifa reducida. Las tarjetas de identificación por LeeTran transporte con foto son hechas en Rosa Parks Centro de Transporte, 2250 Widman Way, Fort Myers, a un costo único de \$1.00. Personas mayores, o personas con discapacidades tendrá que proveer certificaciones medical, Estudiantes tendran que demostrar comprobante de matriculación escolar.

## Trolley Service

Servicio de Tranvía

LeeTran operates a trolley route connecting the mainland to Estero Island and Fort Myers Beach. During the peak tourist season from January to April, there are two trolley routes: the Beach Park & Ride (Route 490) and the Beach Trolley (Route 410). During the rest of the year, these are merged into a single route, Route 400. The timetables also change seasonally.

Riders can get real-time information by downloading the Transit app on mobile devices. **FREE** parking is available at the Beach Park and Ride, corner of Pine Ridge Road and Summerlin Square Drive. **FREE** seasonal service is offered on the Ft. Myers Beach Tram (Route 420) and the Downtown Ft. Myers River District Trolley (Blue and Gold Lines).

LeeTran opera una ruta de tranvía que conecta el continente a la isla Estero y Fort Myers Beach. Durante la temporada alta de turismo de enero a abril, hay dos rutas de tranvía: el Beach Park & Ride (Ruta 490) y el Beach Trolley (Ruta 410). Durante el resto del año, éstos se fusionan en una sola ruta, la ruta 400. Los horarios también cambian según la temporada.

Pasajeros de tránsito pueden obtener información en tiempo real via la aplicación Transit en dispositivos móviles. Estacionamiento **GRATIS** disponible en el Beach Park and Ride, en la esquina de Pine Ridge Road y Summerlin Square Drive. Servicio de temporada **GRATIS** se ofrece en la tranvía de Ft. Myers Beach (Ruta 420) y en el trolebús en el centro de las ciudad de Ft. Myers (Blue and Gold Lines).

## Route Timetables

Itinerarios de Las Rutas

Each LeeTran route has a brochure-sized schedule that includes a map of the route and arrival times at major locations. (The bus makes more stops along the route than those listed.) The schedule may also contain separate timetables for weekday and weekend trips. You can pick up the schedules you need at the Rosa Parks Transportation Center, public libraries and many other locations, or on our website, [www.rideleetrans.com](http://www.rideleetrans.com).

Cada ruta del LeeTran tiene un folleto que incluye el mapa de la ruta y las horas de llegada. (El autobús hace más paradas que las que están marcadas en el folleto.) El horario también puede contener los itinerarios separados para los viajes de los fines de semana. Usted puede tomar los folletos con los horarios que usted necesite en el Centro de Transportes Rosa Parks, en las bibliotecas y muchos otros lugares, o en nuestra página de la red: [www.rideleetrans.com](http://www.rideleetrans.com).

## Transit Fares

Tarifas de Pasaje

Please refer to individual bus schedules for the fare on that route. Please be prepared to pay the exact fare. Drivers do not make change. Once a fare has been deposited in the farebox, it cannot be retrieved. Fares must be paid when boarding the bus.

Discounts: Passengers age 65 and over, disabled persons, and full-time students are eligible to ride at half fare with a LeeTran identification card. Please show the driver your LeeTran I.D. before paying the fare. Acceptable forms of identification are a Medicare card or LeeTran photo I.D. Pre-school children (under 42 inches) ride free with an adult.

Por favor busque en el folleto de los horarios por el precio del pasaje de esa ruta. Por favor este preparado para pagar la cantidad exacta del pasaje. Los choferes no pueden darle cambio. Ya que se ha puesto el pasaje en la caja, no se puede sacar. El pasaje se debe pagar al momento de abordar.

Descuentos: Pasajeros de 65 años y más, personas con discapacidades, y estudiantes son elegibles para media tarifa con una tarjeta de identificación emitío por LeeTran. Por favor muestre su identificación antes de pagar su tarifa. Tarjetas de identificación aceptables son de medicare o LeeTran con foto.

A paratransit service called Passport is available for those whose disabilities make it impossible for them to use a regular bus. Passport operates in the same service area, during the same hours, and on the same days as regular route bus service. A certification process is required; to obtain an application or additional information, call the Passport office at 239-533-0300 Monday through Friday between 8 a.m. and 5 p.m.

El servicio paratransit llamado Pasaporte está disponible para aquellos que sus incapacidades hacen imposible para que ellos puedan usar un autobús regular. El servicio Pasaporte opera en la misma zona, durante las mismas, y los mismos días que los autobuses regulares. Un proceso de certificación es requerido; para obtener una solicitud o más información, llame a la oficina del Pasaporte al (239) 533-0300 de lunes a viernes entre las 8:00 de la mañana a las 5:00 de la tarde.

## Holiday Service

Los Servicios en los Días Feriados

There is no LeeTran service on the following holidays:

- New Year’s Day
- Memorial Day
- 4th of July
- Labor Day
- Thanksgiving Day
- Christmas Day

No hay servicio para los autobuses de LeeTran en los siguientes Días Feriados:

- Año Nuevo
- Día Conmemorativo
- El 4 de julio
- El Día del Trabajo
- El Día del Acción de Gracias
- Navidad

## Lost and Found

Objetos Perdidos y Encontrados

Articles left on the buses are collected at the end of the day and held for 90 days per state statute. Parishables (food items)are thrown out the same day. If you have lost an item on the bus, please call 533-8726 to determine if it can be recovered. LeeTran is not responsible for lost or stolen items.

Los objetos que fueron olvidados en los autobuses son recogidos al finalizar el día y serán guardados por 90 días. Si usted ha olvidado un objeto en el autobús, por favor llame al 533-8726 para determinar si se puede recuperar. LeeTran no es responsable por los objetos olvidados o robados.

## Title VI Compliance

Título VI Cumplimiento

LeeTran complies with Title VI of the Civil Rights Act of 1964 which prohibits discrimination on the basis of race, color or national origin. If you feel you have been discriminated against, you may file a complaint by calling LeeTran at 533-8726 or Lee County’s Office of Equal Employment Opportunity at 533-2245.

LeeTran cumple con el Título VI del Acta de Derechos Civiles de 1964 que prohíbe la discriminación por causa de su raza, color or nación de origen en cualquier programa o actividad que recibe dinero federal. Para reportar violaciones llame a LeeTran at 533-8726 o las oficinas del Condado de Lee al 533-2245.

## Existing Year (2019) Volume Development

**I-75 SOUTH CORRIDOR MASTER PLAN**

---

EXISTING CONDITIONS TRAFFIC TECHNICAL MEMORANDUM

## 1.0 Traffic Data Collection

Traffic counts were collected by FTE, Inc. during February, and March 2019. There were two 72-hour bi-directional classification count, seven 72-hour bi-directional volume counts, and five turning movement counts (TMCs) collected between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. **Table 1.1** provides a list of all data collection efforts. An analysis of these counts indicates the AM peak hour occurred between 7:15 AM and 8:15 AM and the PM peak hour occurred between 4:45 PM and 5:45 PM.

**Table 1.1: Traffic Data Collection**

Location	Type of Count
<b><i>I-75 Ramps</i></b>	
SB On Ramp	72-Hour Volume Count
NB Off Ramp	72-Hour Volume Count
NB On Ramp	72-Hour Volume Count
SB Off Ramp	72-Hour Volume Count
<b><i>Cross Street</i></b>

## 2.0 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the Existing Year (2019) design traffic volumes for the interchange study area. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*.

### 2.1 Field Collected AADT

Existing Year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the three-day average of the 72-hour count data by seasonal and axle adjustment factors. Seasonal and axle correction factors were downloaded from Florida Traffic Online, prior to the release of the 2019 data. A comparison of the 2018 seasonal and axle correction factors to the recently released 2019 data indicates only minimal differences and so the 2018 correction factors were not updated to 2019. **Table 2.1** summarizes the field collected Existing Year (2019) AADT volumes.

**Table 2.1: Field Collected Existing Year (2019) AADT**

Location	2019 Count	Seasonal Factor	Axle Factor	2019 AADT	2019 AADT (Rounded)**
<b>I-75 Ramps</b>					
SB On Ramp	15,017	0.95	0.86	12,269	12,500
NB Off Ramp	11,616	0.95	0.86	9,490	9,500
NB On Ramp	1,565	0.95	0.86	1,279	1,300
SB Off Ramp	2,437	0.95	0.86	1,991	2,000
<b>Along Cross Street</b>					
SR 78, east of Williamsburg Drive*	32,898	0.95	N/A	31,253	31,500
SR 78, east of Wells Road*	15,853	0.95	N/A	15,060	15,000
SR 78 between Park 78 Drive and I-75 SB Ramps	38,298	0.95	0.86	31,289	31,500
SR 78, east of I-75 NB Ramps	18,141	0.95	0.86	14,821	15,000
SR 78 between Pritchett Parkway and Wells Road	17,174	0.95	0.86	14,031	14,000

\*This count was a vehicle classification count.

\*\*AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

### 2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the Existing Year (2019), Opening Year (2025), and Design Year (2040) design traffic volumes.

#### 2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured at each intersection within the study area was used for the Existing Year (2019) for the AM and PM peak hours. **Table 2.2** summarizes the existing AM and PM PHFs for the 5 intersections in the study area. During the AM peak hour, the PHF ranges from 0.89 to 0.98 with a weighted average of 0.93. During the PM peak hour, the PHF ranges from 0.93 to 0.95 with a weighted average of 0.94.

Table 2.2: Field Measured Peak Hour Factors

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
SR 78 and Park 78 Drive	0.98	0.94
SR 78 and I-75 SB Ramps	0.98	0.95
SR 78 and I-75 NB Ramps	0.89	0.95
SR 78 and Pritchett Parkway	0.91	0.93
SR 78 and Wells Road	0.91	0.94
<b>Average</b>	<b>0.93</b>	<b>0.94</b>

However, a PHF of 0.94 is recommended for Opening Year (2025) and Design Year (2040) analysis.

### 2.2.2 Peak to Daily Ratio

The peak to daily ratio (PTD) represents the proportion of AADT occurring during the design hour. **Table 2.3** summarizes the PTD that occurred during the AM and PM peak hours. The weighted average of the AM and PM PTD is 9.0 percent. Based on the FDOT's *Project Traffic Forecasting Handbook (2019)*, a standard PTD of 9.0 percent is used for arterials in an urban area. The PTD observed during the data collection would indicate some amount of congestion. The PTD listed in **Table 2.3** was used in the development of exiting traffic volumes but the standard PTD of 9.0 percent will be used for the future traffic.

Table 2.3: Field Measured Peak to Daily Ratio

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	PTD	Volume	PTD
<b>I-75 Ramps</b>					
SB On Ramp	12,269	1,377	11.2%	861	7.0%
NB Off Ramp	9,490	806	8.5%	1,355	14.3%
NB On Ramp	1,279	119	9.3%	101	7.9%
SB Off Ramp	1,991	98	4.9%	139	7.0%
<b>Along Cross Street</b>					
SR 78, east of Williamsburg Drive	31,253	2,913	9.3%	2,759	8.8%
SR 78, east of Wells Road	15,060	1,329	8.8%	1,318	8.8%
SR 78 between Park 78 Drive and I-75 SB Ramps	31,289	2,505	8.0%	2,559	8.2%
SR 78, east of I-75 NB Ramps	14,821	1,361	9.2%	1,375	9.3%
SR 78 between Pritchett Parkway and Wells Road	14,031	1,289	9.2%	1,303	9.3%

### 2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was calculated from the 72-hour bi-directional approach counts for each counted location within the study area. **Tables 2.5** and **2.6** summarize the AM and PM peak hour directional distribution percentages (D factors) for this interchange. The D factor ranged from 56.3 percent to 60.7 percent during the AM peak hour along the cross street, with a peak direction of west throughout. The D factor ranged from 52.6 percent to 67.6 percent during the PM peak hour along the cross street, with a peak direction of east throughout.

Table 2.4: Field Measured D Factors – AM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
<b>Along Cross Street</b>					
SR 78, east of Williamsburg Drive	1,719	1,194	59.0%	57.2%	East
SR 78, east of Wells Road	564	765	57.6%	58.1%	West
SR 78 between Park 78 Drive and I-75 SB Ramps	1,410	1,095	56.3%	56.3%	East
SR 78, east of I-75 NB Ramps	541	820	60.2%	60.7%	West
SR 78 between Pritchett Parkway and Wells Road	542	747	58.0%	58.9%	West

\*Resulting D Factor after volume balancing procedures were conducted.

Table 2.5: Field Measured D Factors – PM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
<b>Along Cross Street</b>					
SR 78, east of Williamsburg Drive	1,231	1,528	55.4%	53.1%	West
SR 78, east of Wells Road	804	514	61.0%	66.8%	East
SR 78 between Park 78 Drive and I-75 SB Ramps	1,226	1,333	52.1%	52.6%	West
SR 78, east of I-75 NB Ramps	890	485	64.7%	67.5%	East
SR 78 between Pritchett Parkway and Wells Road	830	473	63.7%	67.6%	East

\*Resulting D Factor after volume balancing procedures were conducted.

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceed the recommended D factors defined in the FDOT's *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 67.6 percent was used.

#### 2.2.4 Daily and Design Hour Truck Factors

The daily truck ( $T_{24}$ ) factor is the percentage of medium and heavy truck traffic in a 24-hour period. **Table 2.6** summarizes the classification counts collected as a part of this study effort. These counts were collected during February and March 2019.

Table 2.6: Field Measured Daily Vehicle Composition

Location	Total Vehicles	Medium Trucks		Heavy Trucks		Total Trucks ( $T_{24}$ )	
		Count	%	Count	%	Count	%
SR 78, east of Williamsburg Drive	30,858	2,936	9.5%	496	1.6%	3,432	11.1%
SR 78, east of Wells Road	15,060	1,972	13.1%	407	2.7%	2,379	15.8%

**Table 2.7** summarizes the historical AADT and  $T_{24}$  factors for classification counts in the study area found on Florida Traffic Online (FTO).

Table 2.7: Historical AADT and T<sub>24</sub> Factors

Location	COSITE	2017		2018		2019	
		AADT	T <sub>24</sub>	AADT	T <sub>24</sub>	AADT	T <sub>24</sub>
SR 78, east of Nalle Road	120022	12,000	17.5	12,900	16.3	14,600	18.7
NB On Ramp	127083	1,400	13.5	1,700	13	1,800	13.2
SB Off Ramp	127084	1,500	13.5	1,800	13	1,900	13.2
NB Off Ramp	127081	11,500	13.5	13,000	13	13,500	13.2
SB On Ramp	127082	11,500	13.5	13,000	13	13,500	13.2

To develop design truck factors for the study area Florida Traffic Online and the 72-hour classification count were reviewed for each major segment group within the study area. If a 72-hour classification count is available it was used, otherwise Florida Traffic Online was used. **Table 2.8** provides the T<sub>24</sub> and design hourly truck factor (DHT) for each of these locations.

Table 2.8: Design Truck Factors

Location	Count Site	T <sub>24</sub>	DHT
I-75 Ramps	FTO count	13.2	7.0
Cross Street	72-Hour Classification Count	15.8	8.0
Side Streets	No Data	15.8	8.0

## 1.0 Traffic Data Collection

Traffic counts were collected by FTE, Inc. during February, and March 2019. There were two 72-hour bi-directional classification count, eight 72-hour bi-directional volume counts, and five turning movement counts (TMCs) collected between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. **Table 1.1** provides a list of all data collection efforts. An analysis of these counts indicates the AM peak hour occurred between 7:15 AM and 8:15 AM and the PM peak hour occurred between 4:45 PM and 5:45 PM.

**Table 1.1: Traffic Data Collection**

Location	Type of Count
<b><i>I-75 Ramps</i></b>	
Southbound On-Ramp	72-Hour Volume Count
Southbound Off-Ramp	72-Hour Volume Count
Northbound On-Ramp	72-Hour Volume Count
Northbound Off-Ramp	72-Hour Volume Count
<b><i>Along Cross Street</i></b>	
SR 80, east of 1st Street	72-Hour Classification Count
SR 80, east of I-75	72-Hour Volume Count
SR 80, east of Orange River Boulevard/Louise S	72-Hour Volume Count
SR 80, west of I-75	72-Hour Volume Count
<b><i>Along Side Streets</i></b>	
Orange River Boulevard, south of SR 80	72-Hour Classification Count
Orange River Boulevard, south of SR 80	72-Hour Volume Count
<b><i>Intersections</i></b>	
SR 80 and 1st Street	Turning Movement Count
SR 80 and I-75 NB Ramps	Turning Movement Count
SR 80 and I-75 SB Ramps	Turning Movement Count
SR 80 and Orange River Boulevard/Louise Street	Turning Movement Count
SR 80 and Orange River Boulevard/Morse Plaza	Turning Movement Count

## 2.0 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the Existing Year (2019) design traffic volumes for the interchange study area. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*.

### 2.1 Field Collected AADT

Existing Year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the three-day average of the 72-hour count data by seasonal and axle adjustment factors. Seasonal and axle correction factors were downloaded from Florida Traffic Online, prior to the release of the 2019 data. A comparison of the 2018 seasonal and axle correction factors to the recently released 2019 data indicates only minimal differences and so the 2018 correction factors were not updated to 2019. **Table 2.1** summarizes the field collected Existing Year (2019) AADT volumes.

**Table 2.1: Field Collected Existing Year (2019) AADT**

Location	2019 Count	Seasonal Factor	Axle Factor	2019 AADT	2019 AADT (Rounded)**
<b>I-75 Ramps</b>					
Southbound On-Ramp	15,850	0.95	0.93	14,003	14,000
Northbound On-Ramp	4,954	0.95	0.93	4,377	4,400
Northbound Off-Ramp	14,583	0.95	0.93	12,884	13,000
Southbound Off-Ramp	6,600	0.95	0.93	5,831	5,800
<b>Along Cross Street</b>					
SR 80, east of 1st Street	42,001	0.95	N/A	39,901	40,000
SR 80, west of I-75	23,632	0.95	0.93	20,879	21,000
SR 80, east of I-75	45,971	0.95	0.93	40,615	40,500
SR 80, east of Orange River Boulevard/Louise S	43,744	0.95	0.93	38,648	38,500
<b>Along Side Streets</b>					
Orange River Boulevard, south of SR 80	11,044	0.95	N/A	10,492	10,500
Orange River Boulevard, south of SR 80	4,335	0.95	0.93	3,830	3,800

\*This count was a vehicle classification count.

\*\*AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

### 2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the Existing Year (2019), Opening Year (2025), and Design Year (2040) design traffic volumes.

#### 2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured at each intersection within the study area was used for the Existing Year (2019) for the AM and PM peak hours. **Table 2.2** summarizes the existing AM and PM PHFs for the 5 intersections in the study

area. During the AM peak hour, the PHF ranges from 0.88 to 0.93 with a weighted average of 0.91. During the PM peak hour, the PHF ranges from 0.90 to 0.94 with a weighted average of 0.92.

**Table 2.2: Field Measured Peak Hour Factors**

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
SR 80 and Orange River Boulevard/Morse Plaza	0.93	0.90
SR 80 and I-75 SB Ramps	0.90	0.91
SR 80 and I-75 NB Ramps	0.91	0.94
SR 80 and Orange River Boulevard/Louise Street	0.90	0.92
SR 80 and 1st Street	0.88	0.93
<b>Average</b>	<b>0.91</b>	<b>0.92</b>

However, a PHF of 0.92 is recommended for Opening Year (2025) and Design Year (2040) analysis.

### 2.2.2 Peak to Daily Ratio

The peak to daily ratio (PTD) represents the proportion of AADT occurring during the design hour. **Table 2.3** summarizes the PTD that occurred during the AM and PM peak hours. The weighted average of the AM PTD is 7.4 percent. The weighted average of the PM PTD is 8.7 percent. Based on the FDOT's *Project Traffic Forecasting Handbook (2019)*, a standard PTD of 9.0 percent is used for arterials in an urban area. The slightly lower PTD observed during the data collection would indicate some amount of congestion and possibly peak spreading. The PTD listed in **Table 2.3** was used in the development of exiting traffic volumes but the standard PTD of 9.0 percent will be used for the future traffic.

Table 2.3: Field Measured Peak to Daily Ratio

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	PTD	Volume	PTD
<b>I-75 Ramps</b>					
Southbound On-Ramp	14,003	1,298	9.3%	732	5.2%
Northbound On-Ramp	4,377	477	10.9%	534	12.2%
Northbound Off-Ramp	12,884	659	5.1%	1,368	10.6%
Southbound Off-Ramp	5,831	427	7.3%	562	9.6%
<b>Along Cross Street</b>					
SR 80, east of 1st Street	39,901	2,843	7.1%	3,543	8.9%
SR 80, west of I-75	20,879	1,743	8.3%	2,024	9.7%
SR 80, east of I-75	40,615	2,960	7.3%	3,369	8.3%
SR 80, east of Orange River Boulevard/Louise S	38,648	2,621	6.8%	3,112	8.1%
<b>Along Side Streets</b>					
Orange River Boulevard, south of SR 80	10,492	822	7.8%	1,026	9.8%
Orange River Boulevard, south of SR 80	3,830	352	9.2%	342	8.9%

### 2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was calculated from the 72-hour bi-directional approach counts for each counted location within the study area. **Tables 2.5** and **2.6** summarize the AM and PM peak hour directional distribution percentages (D factors) for this interchange. The D factor ranged from 66.2 percent to 71.0 percent during the AM peak hour along the cross street, with a peak direction of west throughout. During the PM peak hour the D factors are not quite as extreme on the cross street, but still high with an east peak direction.

Table 2.4: Field Measured D Factors – AM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
<b>Along Cross Street</b>					
SR 80, east of 1st Street	853	1,990	70.0%	69.4%	West
SR 80, west of I-75	597	1,146	65.7%	66.2%	West
SR 80, east of I-75	781	2,179	73.6%	71.0%	West
SR 80, east of Orange River Boulevard/Louise S	852	1,769	67.5%	69.3%	West
<b>Along Side Streets</b>					
Orange River Boulevard, south of SR 80	622	200	75.7%	73.8%	North
Orange River Boulevard, south of SR 80	196	156	55.7%	51.7%	North

\*Resulting D Factor after volume balancing procedures were conducted.

Table 2.5: Field Measured D Factors – PM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
<b>Along Cross Street</b>					
SR 80, east of 1st Street	2,077	1,466	58.6%	59.0%	East
SR 80, west of I-75	1,183	841	58.4%	60.1%	East
SR 80, east of I-75	1,966	1,403	58.4%	63.5%	East
SR 80, east of Orange River Boulevard/Louise S	1,821	1,291	58.5%	59.7%	East
<b>Along Side Streets</b>					
Orange River Boulevard, south of SR 80	337	689	67.2%	69.1%	South
Orange River Boulevard, south of SR 80	266	76	77.8%	77.1%	North

\*Resulting D Factor after volume balancing procedures were conducted.

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceed the recommended D factors defined in the FDOT's *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 71.0 percent was used.

#### 2.2.4 Daily and Design Hour Truck Factors

The daily truck ( $T_{24}$ ) factor is the percentage of medium and heavy truck traffic in a 24-hour period. **Table 2.6** summarizes the classification counts collected as a part of this study effort. These counts were collected during February and March 2019.

Table 2.6: Field Measured Daily Vehicle Composition

Location	Total Vehicles	Medium Trucks		Heavy Trucks		Total Trucks ( $T_{24}$ )	
		Count	%	Count	%	Count	%
SR 80, east of 1st Street	42,077	3,152	7.5%	1,061	2.5%	4,213	10.0%
Orange River Boulevard, south of SR 80	10,540	867	8.2%	36	0.3%	903	8.6%

**Table 2.7** summarizes the historical AADT and  $T_{24}$  factors for classification counts in the study area found on Florida Traffic Online (FTO).

Table 2.7: Historical AADT and  $T_{24}$  Factors

Location	COSITE	2017		2018		2019	
		AADT	$T_{24}$	AADT	$T_{24}$	AADT	$T_{24}$
NB Off Ramp	127071	13500	13.5	13500	13	14000	13.2
NB On Ramp	127073	4400	13.5	5000	13	5200	13.2
SB Off Ramp	127074	4700	13.5	5300	13	5500	13.2
SB On Ramp	127072	14000	13.5	13500	13	14000	13.2
SR 80, north of Ortiz Avenue	125020	25000	7	24500	8.2	25000	5.8

To develop design truck factors for the study area Florida Traffic Online and the 72-hour classification count were reviewed for each major segment group within the study area. If a 72-hour classification count is available it was used, otherwise Florida Traffic Online was used.

**Table 2.8** provides the  $T_{24}$  and design hourly truck factor (DHT) for each of these locations.

Table 2.8: Design Truck Factors

Location	Count Site	T <sub>24</sub>	DHT
I-75 Ramps	FTO count	13.2	7

Side Streets	72-hour classification count	8.6	5

## 1.0 Traffic Data Collection

Traffic counts were collected by FTE, Inc. during February, and March 2019. There were two 72-hour bi-directional classification count, ten 72-hour bi-directional volume counts, and five turning movement counts (TMCs) collected between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. **Table 1.1** provides a list of all data collection efforts. An analysis of these counts indicates the AM peak hour occurred between 7:15 AM and 8:15 AM and the PM peak hour occurred between 4:45 PM and 5:45 PM.

**Table 1.1: Traffic Data Collection**

## 2.0 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the Existing Year (2019) design traffic volumes for the interchange study area. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*.

### 2.1 Field Collected AADT

Existing Year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the three-day average of the 72-hour count data by seasonal and axle adjustment factors. Seasonal and axle correction factors were downloaded from Florida Traffic Online, prior to the release of the 2019 data. A comparison of the 2018 seasonal and axle correction factors to the recently released 2019 data indicates only minimal differences and so the 2018 correction factors were not updated to 2019. **Table 2.1** summarizes the field collected Existing Year (2019) AADT volumes.

**Table 2.1: Field Collected Existing Year (2019) AADT**

Location	2019 Count	Seasonal Factor	Axle Factor	2019 AADT	2019 AADT (Rounded)**
<b>I-75 Ramps</b>					
Northbound Off-Ramp	5,835	0.9	0.93	4,884	4,900
Northbound On-Ramp	3,550	0.9	0.93	2,971	3,000
Southbound Off-Ramp	3,391	0.9	0.93	2,838	2,800
Southbound On-Ramp	5,658	0.9	0.93	4,736	4,700
<b>Along Cross Street</b>					
Luckett Road, west of Enterprise Parkway	8,481	0.9	N/A	7,633	7,600
Luckett Road, east of Country Lakes	1,248	0.9	N/A	1,123	1,100
Luckett Road, west of I-75	13,412	0.9	0.93	11,226	11,000
Luckett Road, east of I-75	8,687	0.9	0.93	7,271	7,300
Luckett Road, east of northland Road	8,481	0.9	0.93	7,099	7,100
<b>Along Side Streets</b>					
Hamilton Drive, south of Luckett Road	5,696	0.9	0.93	4,768	4,800
Enterprise Road, north of Luckett Road	7,543	0.9	0.93	6,313	6,300
Country Lakes Drive, north of Luckett Road	6,084	0.9	0.93	5,092	5,100

\*This count was a vehicle classification count.

\*\*AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

### 2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the Existing Year (2019), Opening Year (2025), and Design Year (2040) design traffic volumes.

#### 2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured at each intersection within the study area was used for the Existing Year (2019) for the AM and PM

peak hours. **Table 2.2** summarizes the existing AM and PM PHFs for the 5 intersections in the study area. During the AM peak hour, the PHF ranges from 0.80 to 0.91 with a weighted average of 0.85. During the PM peak hour, the PHF ranges from 0.80 to 0.84 with a weighted average of 0.83.

**Table 2.2: Field Measured Peak Hour Factors**

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
Luckett Road and Hamilton Drive	0.83	0.84
I-75 SB Ramps and Luckett Road	0.91	0.84
I-75 NB Ramps and Luckett Road	0.87	0.82
Luckett Road and Northland Road	0.80	0.83
Luckett Road and Country Lakes Drive/Forum Boulevard	0.84	0.80
<b>Average</b>	<b>0.85</b>	<b>0.83</b>

However, a PHF of 0.85 is recommended for Opening Year (2025) and Design Year (2040) analysis.

### 2.2.2 Peak to Daily Ratio

The peak to daily ratio (PTD) represents the proportion of AADT occurring during the design hour. **Table 2.3** summarizes the PTD that occurred during the AM and PM peak hours. The weighted average of the AM PTD is 10 percent. The weighted average of the PM PTD is 7.9 percent. Based on the FDOT's *Project Traffic Forecasting Handbook (2019)*, a standard PTD of 9.0 percent is used for arterials in an urban area. The slightly higher AM PTD observed during the data collection would indicate some amount of congestion and possibly peak spreading. The PTD listed in **Table 2.3** was used in the development of existing traffic volumes but the standard PTD of 9.0 percent will be used for the future traffic.

Table 2.3: Field Measured Peak to Daily Ratio

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	PTD	Volume	PTD
<b>I-75 Ramps</b>					
Northbound Off-Ramp	4,884	335	6.9%	347	7.1%
Northbound On-Ramp	2,971	185	6.2%	333	11.2%
Southbound Off-Ramp	2,838	435	15.3%	131	4.6%
Southbound On-Ramp	4,736	617	13.0%	356	7.5%
<b>Along Cross Street</b>					
Luckett Road, west of Enterprise Parkway	7,633	698	9.1%	624	8.2%
Luckett Road, east of Country Lakes	1,123	78	6.9%	88	7.8%
Luckett Road, west of I-75	11,226	1,125	10.0%	874	7.8%
Luckett Road, east of I-75	7,271	750	10.3%	610	8.4%
Luckett Road, east of northland Road	7,099	644	9.1%	540	7.6%
<b>Along Side Streets</b>					
Hamilton Drive, south of Luckett Road	4,768	348	7.3%	266	5.6%
Enterprise Road, north of Luckett Road	6,313	787	12.5%	554	8.8%
Country Lakes Drive, north of Luckett Road	5,092	575	11.3%	464	9.1%

2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was calculated from the 72-hour bi-directional approach counts for each counted location within the study area. **Tables 2.5** and **2.6** summarize the AM and PM peak hour directional distribution percentages (D factors) for this interchange. The D factor ranged from 55.7 percent to 66.3 percent during the AM peak hour along the cross street, with a peak direction of west throughout. The D factor ranged from 51.5 percent to 64.2 percent during the PM peak hour along the cross street, with a peak direction of east throughout.

Table 2.4: Field Measured D Factors – AM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
<b>Along Cross Street</b>					
Luckett Road, west of Enterprise Parkway	359	339	51.4%	51.7%	East
Luckett Road, east of Country Lakes	22	56	71.8%	60.0%	West
Luckett Road, west of I-75	498	627	55.7%	55.7%	West
Luckett Road, east of I-75	291	459	61.2%	61.7%	West
Luckett Road, east of northland Road	228	416	64.6%	66.3%	West
<b>Along Side Streets</b>					
Hamilton Drive, south of Luckett Road	156	192	55.2%	54.9%	South
Enterprise Road, north of Luckett Road	450	337	57.2%	59.4%	North
Country Lakes Drive, north of Luckett Road	206	369	64.2%	66.8%	South

\*Resulting D Factor after volume balancing procedures were conducted.

**Table 2.5: Field Measured D Factors – PM Peak Hour**

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
<b>Along Cross Street</b>					
Luckett Road, west of Enterprise Parkway	250	374	59.9%	59.6%	West
Luckett Road, east of Country Lakes	42	46	52.3%	51.5%	West
Luckett Road, west of I-75	561	313	64.2%	64.2%	East
Luckett Road, east of I-75	330	280	54.1%	53.5%	East
Luckett Road, east of northland Road	306	234	56.7%	55.8%	East
<b>Along Side Streets</b>					
Hamilton Drive, south of Luckett Road	135	131	50.8%	50.4%	North
Enterprise Road, north of Luckett Road	95	459	82.9%	82.2%	South
Country Lakes Drive, north of Luckett Road	270	194	58.2%	56.5%	North

\*Resulting D Factor after volume balancing procedures were conducted.

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceed the recommended D factors defined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 66.3 percent was used.

#### 2.2.4 Daily and Design Hour Truck Factors

The daily truck ( $T_{24}$ ) factor is the percentage of medium and heavy truck traffic in a 24-hour period. **Table 2.6** summarizes the classification counts collected as a part of this study effort. These counts were collected during February and March 2019.

**Table 2.6: Field Measured Daily Vehicle Composition**

Location	Total Vehicles	Medium Trucks		Heavy Trucks		Total Trucks ( $T_{24}$ )	
		Count	%	Count	%	Count	%
Luckett Road, west of Enterprise Parkway	7,700	1,008	13.1%	212	2.8%	1,220	15.8%
Luckett Road, east of Country Lakes	1,294	143	11.1%	11	0.9%	154	11.9%

**Table 2.7** summarizes the historical AADT and  $T_{24}$  factors for classification counts in the study area found on Florida Traffic Online (FTO).

**Table 2.7: Historical AADT and  $T_{24}$  Factors**

Location	COSITE	2017		2018		2019	
		AADT	$T_{24}$	AADT	$T_{24}$	AADT	$T_{24}$
NB Off Ramp	127061	5500	13.5	5100	13	5300	13.2
NB On Ramp	127063	3000	13.5	2700	13	2800	13.2
SB Off Ramp	127064	3000	13.5	2600	13	2700	13.2
SB On Ramp	127062	5400	13.5	4900	13	5100	13.2

To develop design truck factors for the study area Florida Traffic Online and the 72-hour classification count were reviewed for each major segment group within the study area. If a 72-hour classification count is available it was used, otherwise Florida Traffic Online was used. **Table 2.8** provides the  $T_{24}$  and design hourly truck factor (DHT) for each of these locations.

Table 2.8: Design Truck Factors

Location	Count Site	T <sub>24</sub>	DHT
I-75 Ramps	FTO count	13.2	7
Cross Street	72-hour classification count	15.8	8
Side Streets	No data	15.8	8

## 1.0 Traffic Data Collection

Traffic counts were collected by FTE, Inc. during February, and March 2019. There were four 72-hour bi-directional classification count, nine 72-hour bi-directional volume counts, and seven turning movement counts (TMCs) collected between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. **Table 1.1** provides a list of all data collection efforts. An analysis of these counts indicates the AM peak hour occurred between 7:15 AM and 8:15 AM and the PM peak hour occurred between 4:45 PM and 5:45 PM.

## 2.0 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the Existing Year (2019) design traffic volumes for the interchange study area. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*.

### 2.1 Field Collected AADT

Existing Year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the three-day average of the 72-hour count data by seasonal and axle adjustment factors. Seasonal and axle correction factors were downloaded from Florida Traffic Online, prior to the release of the 2019 data. A comparison of the 2018 seasonal and axle correction factors to the recently released 2019 data indicates only minimal differences and so the 2018 correction factors were not updated to 2019. **Table 2.1** summarizes the field collected Existing Year (2019) AADT volumes.

**Table 2.1: Field Collected Existing Year (2019) AADT**

Location	2019 Count	Seasonal Factor	Axle Factor	2019 AADT	2019 AADT (Rounded)**
<b>I-75 Ramps</b>					
Southbound Off-Ramp	10,550	0.93	0.98	9,615	9,600
Southbound On-Ramp	9,118	0.93	0.98	8,310	8,300
Northbound Off-Ramp	6,610	0.93	0.98	6,024	6,000

MLK Boulevard, east of I-75 NB Ramps	40,811	0.93	0.98	37,195	37,000
MLK Boulevard, east of Destination Drive	45,492	0.93	0.98	41,461	41,500
<b>Along Side Streets</b>					
Ortiz Avenue, north of MLK Boulevard	16,569	0.93	N/A	15,409	15,500
Ortiz Avenue, south of MLK Boulevard	19,379	0.93	N/A	18,022	18,000
Forum Boulevard, south of MLK Boulevard	7,743	0.93	0.98	7,057	7,100

\*This count was a vehicle classification count.

\*\*AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

### 2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the Existing Year (2019), Opening Year (2025), and Design Year (2040) design traffic volumes.

#### 2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured

at each intersection within the study area was used for the Existing Year (2019) for the AM and PM peak hours. **Table 2.2** summarizes the existing AM and PM PHFs for the 7 intersections in the study area. During the AM peak hour, the PHF ranges from 0.88 to 0.93 with a weighted average of 0.90. During the PM peak hour, the PHF ranges from 0.92 to 0.99 with a weighted average of 0.96.

**Table 2.2: Field Measured Peak Hour Factors**

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
Martin Luther King Jr Boulevard and Ortiz Avenue	0.93	0.98
Martin Luther King Jr Boulevard and Park 82 Drive	0.91	0.97
Martin Luther King Jr Boulevard and I-75 SB Ramps	0.89	0.99
Martin Luther King Jr Boulevard and I-75 NB Ramps	0.89	0.97
Martin Luther King Jr Boulevard and Destination Drive	0.88	0.92
Martin Luther King Jr Boulevard and Forum Boulevard	0.88	0.94
Racetrak Driveway and Ortiz Avenue	0.91	0.94
<b>Average</b>	<b>0.90</b>	<b>0.96</b>

However, a PHF of 0.96 is recommended for Opening Year (2025) and Design Year (2040) analysis.

### 2.2.2 Peak to Daily Ratio

The peak to daily ratio (PTD) represents the proportion of AADT occurring during the design hour. **Table 2.3** summarizes the PTD that occurred during the AM and PM peak hours. The weighted average of the AM PTD is 8.2 percent. The weighted average of the PM PTD is 8.5 percent. Based on the FDOT's *Project Traffic Forecasting Handbook (2019)*, a standard PTD of 9.0 percent is used for arterials in an urban area. The slightly lower PTD observed during the data collection would indicate some amount of congestion and possibly peak spreading. The PTD listed in **Table 2.3** was used in the development of exiting traffic volumes but the standard PTD of 9.0 percent will be used for the future traffic.

Table 2.3: Field Measured Peak to Daily Ratio

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	PTD	Volume	PTD
<b>I-75 Ramps</b>					
Southbound Off-Ramp	9,615	822	8.5%	664	6.9%
Southbound On-Ramp	8,310	877	10.6%	551	6.6%
Northbound Off-Ramp	6,024	479	8.0%	835	13.9%
Northbound On-Ramp	9,404	633	6.7%	660	7.0%
<b>Along Cross Street</b>					
MLK Boulevard, west of Ortiz Avenue	48,591	3,672	7.6%	3,877	8.0%
MLK Boulevard, east of Forum Boulevard	37,354	2,831	7.6%	3,221	8.6%
MLK Boulevard, west of Park 82 Drive	48,392	3,901	8.1%	3,991	8.2%
MLK Boulevard W of I-75 SB	42,024	3,862	9.2%	3,805	9.1%
MLK Boulevard, east of I-75 NB Ramps	37,195	3,399	9.1%	3,544	9.5%
MLK Boulevard, east of Destination Drive	41,461	3,272	7.9%	3,477	8.4%
<b>Along Side Streets</b>					
Ortiz Avenue, north of MLK Boulevard	15,409	1,220	7.9%	1,264	8.2%
Ortiz Avenue, south of MLK Boulevard	18,022	1,491	8.3%	1,485	8.2%
Forum Boulevard, south of MLK Boulevard	7,057	568	8.0%	700	9.9%

### 2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was calculated from the 72-hour bi-directional approach counts for each counted location within the study area. **Tables 2.5** and **2.6** summarize the AM and PM peak hour directional distribution percentages (D factors) for this interchange. The D factor ranged from 57.6 percent to 69.5 percent during the AM peak hour along the cross street, with a peak direction of west throughout. The D factor ranged from 56.9 percent to 65.3 percent during the PM peak hour along the cross street, with a peak direction of west throughout.

Table 2.4: Field Measured D Factors – AM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
<b>Along Cross Street</b>					
MLK Boulevard, west of Ortiz Avenue	1,567	2,105	57.3%	57.6%	West
MLK Boulevard, east of Forum Boulevard	933	1,898	67.0%	69.5%	West
MLK Boulevard, west of Park 82 Drive	1,533	2,368	60.7%	62.1%	West
MLK Boulevard W of I-75 SB	1,484	2,378	61.6%	61.6%	West
MLK Boulevard, east of I-75 NB Ramps	1,166	2,233	65.7%	65.9%	West
MLK Boulevard, east of Destination Drive	1,105	2,167	66.2%	67.1%	West
<b>Along Side Streets</b>					
Ortiz Avenue, north of MLK Boulevard	500	720	59.0%	59.0%	South
Ortiz Avenue, south of MLK Boulevard	407	1,084	72.7%	72.7%	South
Forum Boulevard, south of MLK Boulevard	239	329	57.9%	52.1%	South

\*Resulting D Factor after volume balancing procedures were conducted.

**Table 2.5: Field Measured D Factors – PM Peak Hour**

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
<b>Along Cross Street</b>					
MLK Boulevard, west of Ortiz Avenue	2,195	1,682	56.6%	56.9%	East
MLK Boulevard, east of Forum Boulevard	2,045	1,176	63.5%	65.3%	East
MLK Boulevard, west of Park 82 Drive	2,365	1,626	59.3%	61.3%	East
MLK Boulevard W of I-75 SB	2,190	1,615	57.6%	61.8%	East
MLK Boulevard, east of I-75 NB Ramps	2,258	1,286	63.7%	64.8%	East
MLK Boulevard, east of Destination Drive	2,225	1,252	64.0%	64.4%	East
<b>Along Side Streets</b>					
Ortiz Avenue, north of MLK Boulevard	615	649	51.3%	51.5%	South
Ortiz Avenue, south of MLK Boulevard	859	626	57.8%	59.4%	North
Forum Boulevard, south of MLK Boulevard	380	320	54.3%	51.4%	North

\*Resulting D Factor after volume balancing procedures were conducted.

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceed the recommended D factors defined in the FDOT's *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 69.5 percent was used.

#### 2.2.4 Daily and Design Hour Truck Factors

The daily truck ( $T_{24}$ ) factor is the percentage of medium and heavy truck traffic in a 24-hour period. **Table 2.6** summarizes the classification counts collected as a part of this study effort. These counts were collected during February and March 2019.

**Table 2.6: Field Measured Daily Vehicle Composition**

Location	Total Vehicles	Medium Trucks		Heavy Trucks		Total Trucks ( $T_{24}$ )	
		Count	%	Count	%	Count	%
MLK Boulevard, west of Ortiz Avenue	48,591	4,075	8.4%	959	2.0%	5,034	10.4%
MLK Boulevard, east of Forum Boulevard	42,060	2,847	6.8%	583	1.4%	3,430	8.2%
Ortiz Avenue, north of MLK Boulevard	17,047	1,804	10.6%	281	1.6%	2,085	12.2%
Ortiz Avenue, south of MLK Boulevard	20,315	1,705	8.4%	164	0.8%	1,869	9.2%

**Table 2.7** summarizes the historical AADT and  $T_{24}$  factors for classification counts in the study area found on Florida Traffic Online (FTO).

**Table 2.7: Historical AADT and  $T_{24}$  Factors**

Location	COSITE	2017		2018		2019	
		AADT	$T_{24}$	AADT	$T_{24}$	AADT	$T_{24}$
NB Off Ramp	127051	7700	9.9	7300	9.7	7500	10.3
NB On Ramp	127053	8800	9.9	8800	9.7	9100	10.3
SB Off Ramp	127054	8700	9.9	8600	9.7	8900	10.3
SB On Ramp	127052	8100	9.9	7700	9.7	8000	10.3
SR 82, north of CR 884	120021	32000	7.5	32500	9.4	30000	9.5

## MLK Boulevard

To develop design truck factors for the study area Florida Traffic Online and the 72-hour classification count were reviewed for each major segment group within the study area. If a 72-hour classification count is available it was used, otherwise Florida Traffic Online was used. **Table 2.8** provides the  $T_{24}$  and design hourly truck factor (DHT) for each of these locations.

**Table 2.8: Design Truck Factors**

Location	Count Site	$T_{24}$	DHT
I-75 Ramps	FTO count	10.3	6
Cross Street	72-hour classification count	10.4	6
Side Streets	72-hour classification count	12.2	7

## 1.0 Traffic Data Collection

Traffic counts were collected by FTE, Inc. during February, and March 2019. There were five 72-hour bi-directional classification count, thirteen 72-hour bi-directional volume counts, and ten turning movement counts (TMCs) collected between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. **Table 1.1** provides a list of all data collection efforts. An analysis of these counts indicates the AM peak hour occurred between 7:15 AM and 8:15 AM and the PM peak hour occurred between 4:45 PM and 5:45 PM.

**Table 1.1: Traffic Data Collection**

## 2.0 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the Existing Year (2019) design traffic volumes for the interchange study area. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*.

### 2.1 Field Collected AADT

Existing Year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the three-day average of the 72-hour count data by seasonal and axle adjustment factors. Seasonal and axle correction factors were downloaded from Florida Traffic Online, prior to the release of the 2019 data. A comparison of the 2018 seasonal and axle correction factors to the recently released 2019 data indicates only minimal differences and so the 2018 correction factors were not updated to 2019. **Table 2.1** summarizes the field collected Existing Year (2019) AADT volumes.

**Table 2.1: Field Collected Existing Year (2019) AADT**

Location	2019 Count	Seasonal Factor	Axle Factor	2019 AADT	2019 AADT (Rounded)**
<b>I-75 Ramps</b>					
I-75 Northbound On-Ramp from WB Colonial Boulevard	1,665	0.88	0.98	1,436	1,400
Southbound Off-Ramp	12,752	0.88	0.98	10,997	11,000
Southbound On-Ramp	14,388	0.88	0.98	12,408	12,500
I-75 Northbound On-Ramp from EB Colonial Boulevard	9,327	0.88	0.98	8,044	8,000
Northbound Off-Ramp	13,238	0.88	0.98	11,416	11,500
<b>Along Cross Street</b>					
Colonial Boulevard, west of Ortiz Avenue	80,227	0.88	N/A	70,600	70,500
Colonial Boulevard, east of Dynasty Drive	62,167	0.88	N/A	54,707	54,500
Colonial Boulevard, west of I-75 SB Ramps	91,935	0.88	0.98	79,285	79,500
Colonial Boulevard, east of I-75 NB Ramps	61,860	0.88	0.98	53,348	53,500
Colonial Boulevard, east of Forum Boulevard	60,510	0.88	0.98	52,184	52,000
<b>Along Side Streets</b>					
Ortiz Avenue, north of Colonial Boulevard	22,916	0.88	N/A	20,166	20,000
Ortiz Avenue, south of Colonial Boulevard	34,699	0.88	N/A	30,535	30,500
Forum Boulevard, north of Colonial Boulevard	22,843	0.88	N/A	20,102	20,000
Driveway, north of Colonial Boulevard	2,787	0.88	0.98	2,404	2,400
Forum Boulevard, north of Dynasty Drive	10,169	0.88	0.98	8,770	8,800
Dynasty Drive, east of Forum Boulevard	3,277	0.88	0.98	2,826	2,800
Dynasty Drive, north of Colonial Boulevard	1,351	0.88	0.98	1,165	1,200
Driveway, south of Colonial Boulevard	4,764	0.88	0.98	4,108	4,100

\*This count was a vehicle classification count.

\*\*AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

### 2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT’s *Project*

*Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the Existing Year (2019), Opening Year (2025), and Design Year (2040) design traffic volumes.

2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured at each intersection within the study area was used for the Existing Year (2019) for the AM and PM peak hours. **Table 2.2** summarizes the existing AM and PM PHFs for the 10 intersections in the study area. During the AM peak hour, the PHF ranges from 0.90 to 1.0 with a weighted average of 0.96. During the PM peak hour, the PHF ranges from 0.91 to 0.99 with a weighted average of 0.97.

**Table 2.2: Field Measured Peak Hour Factors**

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
Forum Boulevard and Dynasty Drive	0.96	0.95
Colonial Boulevard and Walmart Plaza West	1.00	0.97
Colonial Boulevard and Ortiz Avenue	0.98	0.98
Colonial Boulevard and I-75 SB Ramps	0.97	0.99
Colonial Boulevard and I-75 NB Ramps	0.96	0.94
Colonial Boulevard and Forum Boulevard	0.95	0.97
Ortiz Avenue and Colonial Center Drive	0.95	0.91
Ortiz Avenue and Annette Way	0.98	0.99
Ortiz Avenue and Dani Drive	0.99	0.99
Forum Boulevard and The Home Depot	0.90	0.98
<b>Average</b>	<b>0.96</b>	<b>0.97</b>

However, a PHF of 0.97 is recommended for Opening Year (2025) and Design Year (2040) analysis.

2.2.2 Peak to Daily Ratio

The peak to daily ratio (PTD) represents the proportion of AADT occurring during the design hour. **Table 2.3** summarizes the PTD that occurred during the AM and PM peak hours. The weighted average of the AM PTD is 6.5 percent. The weighted average of the PM PTD is 7.2 percent. Based on the FDOT's *Project Traffic Forecasting Handbook (2019)*, a standard PTD of 9.0 percent is used for arterials in an urban area. The slightly lower PTD observed during the data collection would indicate some amount of congestion and possibly peak spreading. The PTD listed in **Table 2.3** was used in the development of exiting traffic volumes but the standard PTD of 9.0 percent will be used for the future traffic.

Table 2.3: Field Measured Peak to Daily Ratio

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	PTD	Volume	PTD
<b>I-75 Ramps</b>					
I-75 Northbound On-Ramp from WB Colonial Boulevard	1,436	84	5.8%	189	13.2%

Forum Boulevard, north of Colonial Boulevard	20,102	1,119	5.6%	1,532	7.6%
Driveway, north of Colonial Boulevard	2,404	193	8.0%	115	4.8%
Forum Boulevard, north of Dynasty Drive	8,770	717	8.2%	849	9.7%
Dynasty Drive, east of Forum Boulevard	2,826	284	10.0%	219	7.7%
Dynasty Drive, north of Colonial Boulevard	1,165	112	9.6%	107	9.2%
Driveway, south of Colonial Boulevard	4,108	217	5.3%	197	4.8%

2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was calculated from the 72-hour bi-directional approach counts for each counted location within the study area. **Tables 2.5** and **2.6** summarize the AM and PM peak hour directional distribution percentages (D factors) for this interchange. The D factor ranged from 58.5 percent to 61.9 percent during the AM peak hour along the cross street, with a peak direction of west throughout. The D factor ranged from 51.4 percent to 59.5 percent during the PM peak hour along the cross street, with a peak direction of east throughout.

Table 2.4: Field Measured D Factors – AM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
<b>Along Cross Street</b>					
Colonial Boulevard, west of Ortiz Avenue	1,951	2,843	59.3%	58.7%	West
Colonial Boulevard, east of Dynasty Drive	1,299	2,006	60.7%	60.1%	West
Colonial Boulevard, west of I-75 SB Ramps	2,176	3,003	58.0%	59.1%	West
Colonial Boulevard, east of I-75 NB Ramps	1,215	1,846	60.3%	61.9%	West

Colonial Boulevard, east of I-75 NB Ramps	2,358	1,638	59.0%	57.3%	East
Colonial Boulevard, east of Forum Boulevard	2,261	1,664	57.6%	59.5%	East
<b>Along Side Streets</b>					
Ortiz Avenue, north of Colonial Boulevard	671	769	53.4%	54.0%	South
Ortiz Avenue, south of Colonial Boulevard	852	1,021	54.5%	61.0%	South
Forum Boulevard, north of Colonial Boulevard	705	827	54.0%	52.1%	South
Driveway, north of Colonial Boulevard	62	53	53.9%	56.3%	North
Forum Boulevard, north of Dynasty Drive	491	358	57.8%	55.3%	North
Dynasty Drive, east of Forum Boulevard	76	143	65.3%	65.9%	West
Dynasty Drive, north of Colonial Boulevard	91	16	85.0%	80.8%	North
Driveway, south of Colonial Boulevard	138	59	70.1%	73.1%	North

\*Resulting D Factor after volume balancing procedures were conducted.

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceed the recommended D factors defined in the FDOT's *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 61.9 percent was used.

### 2.2.4 Daily and Design Hour Truck Factors

The daily truck ( $T_{24}$ ) factor is the percentage of medium and heavy truck traffic in a 24-hour period. **Table 2.6** summarizes the classification counts collected as a part of this study effort. These counts were collected during February and March 2019.

**Table 2.6: Field Measured Daily Vehicle Composition**

Location	Total Vehicles	Medium Trucks		Heavy Trucks		Total Trucks ( $T_{24}$ )	
		Count	%	Count	%	Count	%
Colonial Boulevard, west of Ortiz Avenue	70,600	4,508	6.4%	633	0.9%	5,141	7.3%
Colonial Boulevard, east of Dynasty Drive	54,740	2,478	4.5%	485	0.9%	2,963	5.4%
Ortiz Avenue, north of Colonial Boulevard	20,214	1,215	6.0%	192	0.9%	1,407	7.0%

## Colonial Boulevard

Ortiz Avenue, south of Colonial Boulevard	30,686	1,770	5.8%	264	0.9%	2,034	6.6%
Forum Boulevard, north of Colonial Boulevard	22,038	1,301	5.9%	226	1.0%	1,527	6.9%

**Table 2.7** summarizes the historical AADT and  $T_{24}$  factors for classification counts in the study area found on Florida Traffic Online (FTO).

**Table 2.7: Historical AADT and  $T_{24}$  Factors**

Location	COSITE	2017		2018		2019	
		AADT	$T_{24}$	AADT	$T_{24}$	AADT	$T_{24}$
NB Off Ramp	127041	14500	9.9	14000	9.7	14500	10.3

## 2.0 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the Existing Year (2019) design traffic volumes for the interchange study area. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*.

### 2.1 Field Collected AADT

Existing Year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the three-day average of the 72-hour count data by seasonal and axle adjustment factors. Seasonal and axle correction factors were downloaded from Florida Traffic Online, prior to the release of the 2019 data. A comparison of the 2018 seasonal and axle correction factors to the recently released 2019 data indicates only minimal differences and so the 2018 correction factors were not updated to 2019. **Table 2.1** summarizes the field collected Existing Year (2019) AADT volumes.

**Table 2.1: Field Collected Existing Year (2019) AADT**

Location	2019 Count	Seasonal Factor	Axle Factor	2019 AADT	2019 AADT (Rounded)**
<b>I-75 Ramps</b>					
I-75 Northbound On-Ramp from EB Daniels Parkway	5,134	0.93	0.99	4,727	4,700
I-75 Northbound On-Ramp from WB Daniels Parkway	5,908	0.93	0.99	5,439	5,400

Treeline Avenue, south of Daniels Parkway	31,836	0.93	0.99	29,311	29,500
CVS Driveway, west of Treeline Avenue	985	0.93	0.99	907	900

\*This count was a vehicle classification count.

\*\*AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

### 2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT's *Project*

*Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the Existing Year (2019), Opening Year (2025), and Design Year (2040) design traffic volumes.

### 2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured at each intersection within the study area was used for the Existing Year (2019) for the AM and PM peak hours. **Table 2.2** summarizes the existing AM and PM PHFs for the 13 intersections in the study area. During the AM peak hour, the PHF ranges from 0.90 to 0.99 with a weighted average of 0.95. During the PM peak hour, the PHF ranges from 0.89 to 0.97 with a weighted average of 0.94.

**Table 2.2: Field Measured Peak Hour Factors**

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
Daniels Parkway and Treeline Avenue	0.95	0.91
Treeline Avenue and Intercom Drive	0.99	0.89
Palomino Ln and Jobe Road	0.90	0.97
Fiddlesticks Boulevard and Cody Lee Road	0.91	0.96
Daniels Parkway and Powers Court	0.92	0.93
Daniels Parkway and Streetarbucks Driveway	0.93	0.93
Daniels Parkway and Fiddlesticks Boulevard/Palomino Ln	0.94	0.95
Daniels Parkway and Skyport Avenue	0.96	0.96
Daniels Parkway and Danport Boulevard	0.96	0.94
Daniels Parkway and I-75 SB Ramps	0.98	0.96
Daniels Parkway and I-75 NB Ramps	0.98	0.94
Daniels Parkway and Intercom Drive	0.96	0.91
Daniels Parkway and Jetport Commerce Parkway	0.95	0.91
<b>Average</b>	<b>0.95</b>	<b>0.94</b>

However, a PHF of 0.95 is recommended for opening year (2025) and design year (2040) analysis.

### 2.2.2 Peak to Daily Ratio

The peak to daily ratio (PTD) represents the proportion of AADT occurring during the design hour. **Table 2.3** summarizes the PTD that occurred during the AM and PM peak hours. The weighted average of the AM PTD is 7.6 percent. The weighted average of the PM PTD is 8.3 percent. Based on the FDOT's *Project Traffic Forecasting Handbook (2019)*, a standard PTD of 9.0 percent is used for arterials in an urban area. The slightly lower PTD observed during the data collection would indicate some amount of congestion and possibly peak spreading. The PTD listed in **Table 2.3** was used in the development of exiting traffic volumes but the standard PTD of 9.0 percent will be used for the future traffic.

Table 2.3: Field Measured Peak to Daily Ratio

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	PTD	Volume	PTD
<b>I-75 Ramps</b>					
I-75 Northbound On-Ramp from EB Daniels Parkway	4,727	253	5.4%	515	10.9%
I-75 Northbound On-Ramp from WB Daniels Parkway	5,439	283	5.2%	673	12.4%
Southbound Off-Ramp	10,857	1,021	9.4%	611	5.6%
Southbound On-Ramp	16,956	1,280	7.5%	978	5.8%
Northbound Off-Ramp	12,936	877	6.8%	1,280	9.9%
<b>Along Cross Street</b>					
Daniels Parkway, east of Powers Court	63,220	4,304	6.8%	4,743	7.5%
Daniels Parkway, east of Jetport Commerce Park	51,011	4,631	9.1%	4,592	9.0%
Daniels Parkway, west of Powers Court	56,824	4,395	7.7%	4,648	8.2%
Daniels Parkway, east of Fiddlesticks Boulevard	65,451	4,824	7.4%	5,343	8.2%

Daniels Parkway, east of I-75 NB Ramps	53,715	4,524	8.4%	4,717	8.8%
Daniels Parkway, east of Treeline Avenue	42,517	3,919	9.2%	3,920	9.2%
<b>Along Side Streets</b>					
Treeline Avenue, north of Daniels Parkway	18,170	1,383	7.6%	1,781	9.8%
Treeline Avenue, south of Intercom Drive	21,485	1,519	7.1%	2,056	9.6%
Treeline Avenue, south of Daniels Parkway	29,311	1,796	6.1%	2,536	8.7%
CVS Driveway, west of Treeline Avenue	907	57	6.3%	89	9.8%

2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was calculated from the 72-hour bi-directional approach counts for each counted location within the study area. **Tables 2.5** and **2.6** summarize the AM and PM peak hour directional distribution percentages (D factors) for this interchange. The D factor ranged from 53.9 percent to 57.1 percent during the AM peak hour along the cross street, with a peak direction of west throughout. The D factor ranged from 50.0 percent to 52.4 percent during the PM peak hour along the cross street, with a peak direction of west throughout.

Table 2.4: Field Measured D Factors – AM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
<b>Along Cross Street</b>					
Daniels Parkway, east of Powers Court	1,775	2,529	58.8%	56.9%	West
Daniels Parkway, east of Jetport Commerce Park	2,103	2,528	54.6%	57.1%	West
Daniels Parkway, west of Powers Court	1,995	2,400	54.6%	55.4%	West
Daniels Parkway, east of Fiddlesticks Boulevard	1,988	2,836	58.8%	54.1%	West

## Daniels Parkway

Daniels Parkway, east of Skyport Avenue	1,969	2,336	54.3%	54.5%	West
Daniels Parkway, west of I-75 SB Ramps	2,081	2,493	54.5%	54.6%	West
Daniels Parkway, east of I-75 NB Ramps	2,054	2,470	54.6%	53.9%	West

<b>Along Side Streets</b>					
Treeline Avenue, north of Daniels Parkway	349	1,034	74.8%	76.1%	South
Treeline Avenue, south of Intercom Drive	444	1,075	70.8%	71.3%	South
Treeline Avenue, south of Daniels Parkway	704	1,092	60.8%	67.6%	South
CVS Driveway, west of Treeline Avenue	27	30	52.6%	63.8%	West

\*Resulting D Factor after volume balancing procedures were conducted.

**Table 2.5: Field Measured D Factors – PM Peak Hour**

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
<b>Along Cross Street</b>					
Daniels Parkway, east of Powers Court	2,325	2,418	51.0%	50.4%	West
Daniels Parkway, east of Jetport Commerce Park	1,972	2,620	57.1%	52.4%	West
Daniels Parkway, west of Powers Court	2,315	2,333	50.2%	51.6%	West
Daniels Parkway, east of Fiddlesticks Boulevard	2,191	3,152	59.0%	50.1%	West
Daniels Parkway, east of Skyport Avenue	2,171	2,370	52.2%	50.0%	West
Daniels Parkway, west of I-75 SB Ramps	2,327	2,479	51.6%	50.4%	West
Daniels Parkway, east of I-75 NB Ramps	2,168	2,549	54.0%	50.9%	West
Daniels Parkway, east of Treeline Avenue	1,899	2,021	51.6%	50.2%	West
<b>Along Side Streets</b>					
Treeline Avenue, north of Daniels Parkway	1,105	676	62.0%	62.2%	North
Treeline Avenue, south of Intercom Drive	1,187	869	57.7%	59.4%	North
Treeline Avenue, south of Daniels Parkway	1,655	881	65.3%	63.4%	North
CVS Driveway, west of Treeline Avenue	46	43	51.7%	84.5%	East

\*Resulting D Factor after volume balancing procedures were conducted.

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceed the recommended D factors defined in the FDOT's *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 57.1 percent was used.

### 2.2.4 Daily and Design Hour Truck Factors

The daily truck ( $T_{24}$ ) factor is the percentage of medium and heavy truck traffic in a 24-hour period. **Table 2.6** summarizes the classification counts collected as a part of this study effort. These counts were collected during February and March 2019.

**Table 2.6: Field Measured Daily Vehicle Composition**

Location	Total Vehicles	Medium Trucks		Heavy Trucks		Total Trucks ( $T_{24}$ )	
		Count	%	Count	%	Count	%
Daniels Parkway, east of Powers Court	63,383	2,478	3.9%	382	0.6%	2,860	4.5%
Daniels Parkway, east of Jetport Commerce Park	59,956	2,920	4.9%	773	1.3%	3,693	6.2%
Treeline Avenue, north of Daniels Parkway	18,289	712	3.9%	76	0.4%	788	4.3%

Treeline Avenue, south of Intercom Drive	24,324	1,092	4.5%	98	0.4%	1,190	4.9%
--	--------	-------	------	----	------	-------	------

**Table 2.7** summarizes the historical AADT and T<sub>24</sub> factors for classification counts in the study area found on Florida Traffic Online (FTO).

**Table 2.7: Historical AADT and T<sub>24</sub> Factors**

Location	COSITE	2017		2018		2019	
		AADT	T <sub>24</sub>	AADT	T <sub>24</sub>	AADT	T <sub>24</sub>
NB Off Ramp	127031	16500	9.9	16500	9.7	17000	10.3
NB On Ramp	127035	6600	9.9	5200	9.7	5400	10.3
NB On Ramp	127033	5800	9.9	5600	9.7	5800	10.3
SB Off Ramp	127034	12500	9.9	11000	9.7	11500	10.3
SB On Ramp	127032	17000	9.9	16000	9.7	16500	10.3

To develop design truck factors for the study area Florida Traffic Online and the 72-hour classification count were reviewed for each major segment group within the study area. If a 72-hour classification count is available it was used, otherwise Florida Traffic Online was used. **Table 2.8** provides the T<sub>24</sub> and design hourly truck factor (DHT) for each of these locations.

**Table 2.8: Design Truck Factors**

Location	Count Site	T <sub>24</sub>	DHT
I-75 Ramps	FTO Count	10.3	6
Cross Street	72-hour classification count	6.2	4
Side Streets	72-hour classification count	4.9	3

## 1.0 Traffic Data Collection

Traffic counts were collected by FTE, Inc. during February, and March 2019. There were three 72-hour bi-directional classification count, fourteen 72-hour bi-directional volume counts, and ten turning movement counts (TMCs) collected between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. **Table 1.1** provides a list of all data collection efforts. An analysis of these counts indicates the AM peak hour occurred between 7:15 AM and 8:15 AM and the PM peak hour occurred between 4:45 PM and 5:45 PM.

**Table 1.1: Traffic Data Collection**

## 2.0 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the Existing Year (2019) design traffic volumes for the interchange study area. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*.

### 2.1 Field Collected AADT

Existing Year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the three-day average of the 72-hour count data by seasonal and axle adjustment factors. Seasonal and axle correction factors were downloaded from Florida Traffic Online, prior to the release of the 2019 data. A comparison of the 2018 seasonal and axle correction factors to the recently released 2019 data indicates only minimal differences and so the 2018 correction factors were not updated to 2019. **Table 2.1** summarizes the field collected Existing Year (2019) AADT volumes.

**Table 2.1: Field Collected Existing Year (2019) AADT**

Location	2019 Count	Seasonal Factor	Axle Factor	2019 AADT	2019 AADT (Rounded)**
<b>I-75 Ramps</b>					
Southbound Off-Ramp (Terminal Access)	7,097	0.88	0.99	6,183	6,200
Southbound On-Ramp (Terminal Access)	11,282	0.88	0.99	9,829	9,800
Northbound Off-Ramp (Terminal Access)	10,522	0.88	0.99	9,167	9,200
Northbound On-Ramp (Terminal Access)	5,760	0.88	0.99	5,018	5,000
Southbound Off-Ramp	16,760	0.88	0.99	14,601	14,500
I-75 Southbound On-Ramp from EB Alico Road	7,092	0.88	0.99	6,179	6,200
Northbound Off-Ramp	8,893	0.88	0.99	7,748	7,700
I-75 Northbound On-Ramp from WB Alico Road	8,108	0.88	0.99	7,064	7,100
I-75 Southbound On-Ramp from WB Alico Road	3,476	0.88	0.99	3,028	3,000
I-75 Northbound On-Ramp from EB Alico Road	8,102	0.88	0.99	7,058	7,100
<b>Along Cross Street</b>					
Alico Road, east of Ben Hill Griffin Parkway	8,663	0.88	N/A	7,623	7,600
Alico Road, west of 3 Oaks Parkway	45,857	0.88	0.99	39,951	40,000
Alico Road, east of I-75 NB Ramps	50,010	0.88	0.99	43,569	43,500
Alico Road, east of Royal Queen Boulevard	37,053	0.88	0.99	32,281	32,500
<b>Along Side Streets</b>					
Ben Hill Griffin Parkway, north of Alico Road	33,421	0.88	N/A	29,410	29,500

\*This count was a vehicle classification count.

\*\*AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

### 2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the Existing Year (2019), Opening Year (2025), and Design Year (2040) design traffic volumes.

2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured at each intersection within the study area was used for the Existing Year (2019) for the AM and PM peak hours. **Table 2.2** summarizes the existing AM and PM PHFs for the 10 intersections in the study area. During the AM peak hour, the PHF ranges from 0.83 to 0.96 with a weighted average of 0.90. During the PM peak hour, the PHF ranges from 0.87 to 0.97 with a weighted average of 0.93.

**Table 2.2: Field Measured Peak Hour Factors**

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
Alico Road and 3 Oaks Parkway	0.96	0.91
Terminal Access Road and Ben Hill Griffin Parkway	0.95	0.97
Alico Road and I-75 SB Ramps	0.96	0.93
Alico Road and I-75 NB Ramps	0.90	0.93
Alico Road and Royal Queen Boulevard	0.87	0.87
Alico Road and Ben Hill Griffin Parkway	0.89	0.91
Ben Hill Griffin Parkway and Hilton Garden Way	0.90	0.96
Ben Hill Griffin Parkway and Homewood Suites Drive	0.89	0.96
Ben Hill Griffin Parkway and Royal University Drive	0.83	0.92
Ben Hill Griffin Parkway and Gulf Center Drive	0.88	0.92
<b>Average</b>	<b>0.90</b>	<b>0.93</b>

However, a PHF of 0.93 is recommended for opening year (2025) and design year (2040) analysis.

2.2.2 Peak to Daily Ratio

The peak to daily ratio (PTD) represents the proportion of AADT occurring during the design hour. **Table 2.3** summarizes the PTD that occurred during the AM and PM peak hours. The weighted average of the AM PTD is 6.0 percent. The weighted average of the PM PTD is 7.8 percent. Based on the FDOT’s *Project Traffic Forecasting Handbook (2019)*, a standard PTD of 9.0 percent is used for arterials in an urban area. The slightly lower PTD observed during the data collection would indicate some amount of congestion and possibly peak spreading. The PTD listed in **Table 2.3** was used in the development of exiting traffic volumes but the standard PTD of 9.0 percent will be used for the future traffic.

Table 2.3: Field Measured Peak to Daily Ratio

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	PTD	Volume	PTD
<b>I-75 Ramps</b>					
Southbound Off-Ramp (Terminal Access)	6,183	262	4.2%	346	5.6%
Southbound On-Ramp (Terminal Access)	9,829	202	2.1%	687	7.0%
Northbound Off-Ramp (Terminal Access)	9,167	295	3.2%	531	5.8%
Northbound On-Ramp (Terminal Access)	5,018	116	2.3%	320	6.4%
Southbound Off-Ramp	14,601	1,130	7.7%	1,010	6.9%
I-75 Southbound On-Ramp from EB Alico Road	6,179	538	8.7%	482	7.8%
Northbound Off-Ramp	7,748	603	7.8%	750	9.7%
I-75 Northbound On-Ramp from WB Alico Road	7,064	317	4.5%	538	7.6%
I-75 Southbound On-Ramp from WB Alico Road	3,028	192	6.3%	217	7.2%
I-75 Northbound On-Ramp from EB Alico Road	7,058	602	8.5%	616	8.7%
<b>Along Cross Street</b>					
Alico Road, east of Ben Hill Griffin Parkway	7,623	665	8.7%	579	7.6%
Alico Road, west of 3 Oaks Parkway	39,951	3,070	7.7%	3,390	8.5%
Alico Road, east of I-75 NB Ramps	43,569	2,284	5.2%	3,393	7.8%
Alico Road, east of Royal Queen Boulevard	32,281	1,918	5.9%	2,554	7.9%
<b>Along Side Streets</b>					
Ben Hill Griffin Parkway, north of Alico Road	29,410	1,515	5.2%	2,395	8.1%

2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was calculated from the 72-hour bi-directional approach counts for each counted location within the study area. **Tables 2.5** and **2.6** summarize the AM and PM peak hour directional distribution percentages (D factors) for this interchange. The D factor ranged from 53.2 percent to 56.6 percent during the AM peak hour along the cross street, with a peak direction of east throughout. The D factor ranged from 51.3 percent to 58.0 percent during the AM peak hour along the cross street, with a peak direction of west throughout.

Table 2.4: Field Measured D Factors – AM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
<b>Along Cross Street</b>					
Alico Road, east of Ben Hill Griffin Parkway	427	238	64.2%	54.9%	East
Alico Road, west of 3 Oaks Parkway	1,464	1,606	52.3%	53.2%	West
Alico Road, east of I-75 NB Ramps	1,241	1,043	54.3%	56.6%	East
Alico Road, east of Royal Queen Boulevard	966	952	50.4%	54.9%	East
<b>Along Side Streets</b>					
Ben Hill Griffin Parkway, north of Alico Road	490	1,025	67.7%	70.0%	South

\*Resulting D Factor after volume balancing procedures were conducted.

**Table 2.5: Field Measured D Factors – PM Peak Hour**

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
<b>Along Cross Street</b>					
Alico Road, east of Ben Hill Griffin Parkway	315	264	54.4%	52.6%	East
Alico Road, west of 3 Oaks Parkway	1,833	1,557	54.1%	52.4%	East
Alico Road, east of I-75 NB Ramps	1,749	1,644	51.5%	51.3%	East
Alico Road, east of Royal Queen Boulevard	1,106	1,448	56.7%	58.0%	West
<b>Along Side Streets</b>					
Ben Hill Griffin Parkway, north of Alico Road	1,255	1,140	52.4%	51.9%	North

\*Resulting D Factor after volume balancing procedures were conducted.

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceed the recommended D factors defined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 58.0 percent was used.

#### 2.2.4 Daily and Design Hour Truck Factors

The daily truck ( $T_{24}$ ) factor is the percentage of medium and heavy truck traffic in a 24-hour period. **Table 2.6** summarizes the classification counts collected as a part of this study effort. These counts were collected during February and March 2019.

**Table 2.6: Field Measured Daily Vehicle Composition**

Location	Total Vehicles	Medium Trucks		Heavy Trucks		Total Trucks ( $T_{24}$ )	
		Count	%	Count	%	Count	%
I-75, south of Terminal Access Road	75,466	5,692	7.5%	1,753	2.3%	7,445	9.9%
Alico Road, east of Ben Hill Griffin Parkway	7,723	2,180	28.2%	788	10.2%	2,968	38.4%
Ben Hill Griffin Parkway, north of Alico Road	29,266	1,357	4.6%	124	0.4%	1,481	5.1%

**Table 2.7** summarizes the historical AADT and  $T_{24}$  factors for classification counts in the study area found on Florida Traffic Online (FTO).

Table 2.7: Historical AADT and T<sub>24</sub> Factors

Location	COSITE	2017		2018		2019	
		AADT	T <sub>24</sub>	AADT	T <sub>24</sub>	AADT	T <sub>24</sub>
I-75 NB On Ramp at Airport Interchange	125215	-	-	-	-	6800	10.3
I-75 SB Off Ramp for Airport Interchange	125216	-	-	-	-	9000	10.3
I-75 SB On Ramp from Airport Interchange	125217	-	-	-	-	9000	10.3
NB Off Ramp	127021	12500	9.9	9500	9.7	9800	10.3
NB On Ramp	127110	6600	9.9	6800	9.7	7000	10.3
NB On Ramp from Alico Road EB	127023	12000	9.9	7000	9.7	7200	10.3
SB Off Ramp	127111	12500	9.9	13500	9.7	14000	10.3
SB On Ramp	127022	12500	9.9	6300	9.7	6500	10.3
SB On Ramp from Alico Road WB	127024	12500	9.9	3300	9.7	3400	10.3
Alico Road, east of Ben Hill Griffin Parkway	120118	7400	52.7	7400	43.5	7800	38
Ben Hill Griffin Parkway, south of Alico Road	124514	23000	3.2	22500	2.3	23500	3
Three Oaks Parkway, south of Alico Road	124414	13900	4	16500	5.7	16200	5.3

To develop design truck factors for the study area Florida Traffic Online and the 72-hour classification count were reviewed for each major segment group within the study area. If a 72-hour classification count is available it was used, otherwise Florida Traffic Online was used. **Table 2.8** provides the T<sub>24</sub> and design hourly truck factor (DHT) for each of these locations.

Table 2.8: Design Truck Factors

Location	Count Site	T <sub>24</sub>	DHT
I-75 Ramps	FTO count	10.3	6
Cross Street	72-hour classification count	38.4	20
Side Streets	72-hour classification count	9.9	5

## 1.0 Traffic Data Collection

Traffic counts were collected by FTE, Inc. during February, and March 2019. There were three 72-hour bi-directional classification count, nine 72-hour bi-directional volume counts, and fourteen turning movement counts (TMCs) collected between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. **Table 1.1** provides a list of all data collection efforts. An analysis of these counts indicates the AM peak hour occurred between 7:15 AM and 8:15 AM and the PM peak hour occurred between 4:45 PM and 5:45 PM.

**Table 1.1: Traffic Data Collection**

## 2.0 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the Existing Year (2019) design traffic volumes for the interchange study area. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*.

### 2.1 Field Collected AADT

Existing Year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the three-day average of the 72-hour count data by seasonal and axle adjustment factors. Seasonal and axle correction factors were downloaded from Florida Traffic Online, prior to the release of the 2019 data. A comparison of the 2018 seasonal and axle correction factors to the recently released 2019 data indicates only minimal differences and so the 2018 correction factors were not updated to 2019. **Table 2.1** summarizes the field collected Existing Year (2019) AADT volumes.

**Table 2.1: Field Collected Existing Year (2019) AADT**

Location	2019 Count	Seasonal Factor	Axle Factor	2019 AADT	2019 AADT (Rounded)**
<b>I-75 Ramps</b>					
Southbound Off-Ramp	11,791	0.89	0.99	10,389	10,500
Southbound On-Ramp	12,189	0.89	0.99	10,740	10,500
Northbound Off-Ramp	11,436	0.89	0.99	10,076	10,000
Northbound On-Ramp	11,994	0.89	0.99	10,568	10,500
<b>Along Cross Street</b>					
Corkscrew Road, east of I-75 NB Ramps	37,966	0.89	N/A	33,790	34,000
Corkscrew Road, west of I-75 SB Ramps	47,853	0.89	N/A	42,589	42,500
Corkscrew Road, west of 3 Oaks Parkway	29,678	0.89	0.99	26,149	26,000
Corkscrew Road, east of Ben Hill Griffin Parkway	24,640	0.89	0.99	21,710	21,500
<b>Along Side Streets</b>					
Stoneybrook Golf Boulevard, south of Corkscrew	8,600	0.89	N/A	7,654	7,700
3 Oaks Parkway, north of Corkscrew Road	27,492	0.89	0.99	24,223	24,000
3 Oaks Parkway, south of Corkscrew Road	30,079	0.89	0.99	26,503	26,500
Miromar Design Center, south of Corkscrew Road	509	0.89	0.99	448	450

\*This count was a vehicle classification count.

\*\*AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

### 2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the Existing Year (2019), Opening Year (2025), and Design Year (2040) design traffic volumes.

2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured at each intersection within the study area was used for the Existing Year (2019) for the AM and PM peak hours. **Table 2.2** summarizes the existing AM and PM PHFs for the 14 intersections in the study area. During the AM peak hour, the PHF ranges from 0.88 to 0.97 with a weighted average of 0.94. During the PM peak hour, the PHF ranges from 0.94 to 0.99 with a weighted average of 0.96.

**Table 2.2: Field Measured Peak Hour Factors**

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
3 Oaks Parkway and Estero Town Commons PI	0.93	0.95
Ben Hill Griffin Parkway and South Factory Outlet Entrance	0.94	0.95
Ben Hill Griffin Parkway and North Factory Outlet Entrance	0.88	0.95
Stoneybrook Golf Boulevard and CVS	0.90	0.95
Corkscrew Road and Stoneybrook Golf Drive	0.90	0.97
Corkscrew Road and 3 Oaks Parkway	0.95	0.98
Corkscrew Road and Puerto Way	0.96	0.97
Corkscrew Road and Puente Way	0.95	0.95
Corkscrew Road and Corkscrew Commons Drive	0.97	0.94
Corkscrew Road and Corkscrew Woodlands Boulevard	0.97	0.94
Corkscrew Road and I-75 SB Ramps	0.97	0.96
Corkscrew Road and I-75 NB Ramps	0.95	0.96
Corkscrew Road and Factory Outlet Entrance	0.95	0.98
Corkscrew Road and Ben Hill Griffin Parkway	0.94	0.99
<b>Average</b>	<b>0.94</b>	<b>0.96</b>

However, a PHF of 0.95 is recommended for Opening Year (2025) and Design Year (2040) analysis.

2.2.2 Peak to Daily Ratio

The peak to daily ratio (PTD) represents the proportion of AADT occurring during the design hour. **Table**

.3 summarizes the PTD that occurred during the AM and PM peak hours. The weighted average of the AM PTD is 6.7 percent. The weighted average of the PM PTD is 8.0 percent. Based on the FDOT’s *Project Traffic Forecasting Handbook (2019)*, a standard PTD of 9.0 percent is used for arterials in an urban area. The slightly lower PTD observed during the data collection would indicate some amount of congestion and possibly peak spreading. The PTD listed in **Table 2.3** was used in the development of exiting traffic volumes but the standard PTD of 9.0 percent will be used for the future traffic.

**Table 2.3: Field Measured Peak to Daily Ratio**

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	PTD	Volume	PTD
<b>I-75 Ramps</b>					
Southbound Off-Ramp	10,389	773	7.4%	662	6.4%
Southbound On-Ramp	10,740	946	8.8%	713	6.6%
Northbound Off-Ramp	10,076	636	6.3%	786	7.8%
Northbound On-Ramp	10,568	526	5.0%	886	8.4%
<b>Along Cross Street</b>					
Corkscrew Road, east of I-75 NB Ramps	33,790	2,241	6.6%	2,973	8.8%
Corkscrew Road, west of I-75 SB Ramps	42,589	2,950	6.9%	3,272	7.7%
Corkscrew Road, west of 3 Oaks Parkway	26,149	1,747	6.7%	2,095	8.0%
Corkscrew Road, east of Ben Hill Griffin Parkway	21,710	1,759	8.1%	1,728	8.0%
<b>Along Side Streets</b>					
Stoneybrook Golf Boulevard, south of Corkscrew	7,654	429	5.6%	696	9.1%
3 Oaks Parkway, north of Corkscrew Road	24,223	1,693	7.0%	2,019	8.3%
3 Oaks Parkway, south of Corkscrew Road	26,503	1,861	7.0%	2,114	8.0%
Miromar Design Center, south of Corkscrew Road	448	18	4.0%	44	9.8%

2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was calculated from the 72-hour bi-directional approach counts for each counted location within the study area. **Tables 2.5** and **2.6** summarize the AM and PM peak hour directional distribution percentages (D factors) for this interchange. The D factor ranged from 59.4 percent to 64.6 percent during the AM peak hour along the cross street, with a peak direction of west throughout. During the PM peak hour, the D factors are not quite as extreme on the cross street, but still high with an east peak direction.

**Table 2.4: Field Measured D Factors – AM Peak Hour**

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
<b>Along Cross Street</b>					
Corkscrew Road, east of I-75 NB Ramps	843	1,398	62.4%	63.0%	West
Corkscrew Road, west of I-75 SB Ramps	1,217	1,733	58.7%	59.4%	West
Corkscrew Road, west of 3 Oaks Parkway	611	1,136	65.0%	64.0%	West
Corkscrew Road, east of Ben Hill Griffin Parkway	629	1,130	64.2%	64.6%	West
<b>Along Side Streets</b>					
Stoneybrook Golf Boulevard, south of Corkscrew	280	149	65.3%	65.0%	North
3 Oaks Parkway, north of Corkscrew Road	404	1,289	76.1%	76.0%	South
3 Oaks Parkway, south of Corkscrew Road	601	1,260	67.7%	67.8%	South
Miromar Design Center, south of Corkscrew Road	5	13	72.2%	83.9%	South

\*Resulting D Factor after volume balancing procedures were conducted.

Table 2.5: Field Measured D Factors – PM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
<b>Along Cross Street</b>					
Corkscrew Road, east of I-75 NB Ramps	1,691	1,282	56.9%	54.9%	East
Corkscrew Road, west of I-75 SB Ramps	1,874	1,398	57.3%	56.7%	East
Corkscrew Road, west of 3 Oaks Parkway	1,217	878	58.1%	57.5%	East
Corkscrew Road, east of Ben Hill Griffin Parkway	1,035	693	59.9%	57.6%	East
<b>Along Side Streets</b>					
Stoneybrook Golf Boulevard, south of Corkscrew	264	432	62.1%	59.6%	South
3 Oaks Parkway, north of Corkscrew Road	1,236	783	61.2%	60.5%	North
3 Oaks Parkway, south of Corkscrew Road	1,275	839	60.3%	58.4%	North
Miromar Design Center, south of Corkscrew Road	12	32	72.7%	68.3%	South

\*Resulting D Factor after volume balancing procedures were conducted.

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceeded the recommended D factors defined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 64.6 percent was used.

2.2.4 Daily and Design Hour Truck Factors

The daily truck (T<sub>24</sub>) factor is the percentage of medium and heavy truck traffic in a 24-hour period. **Table 2.6** summarizes the classification counts collected as a part of this study effort. These counts were collected during February and March 2019.

Table 2.6: Field Measured Daily Vehicle Composition

Location	Total Vehicles	Medium Trucks		Heavy Trucks		Total Trucks (T <sub>24</sub> )	
		Count	%	Count	%	Count	%
Corkscrew Road, east of I-75 NB Ramps	37,771	2,064	5.5%	210	0.6%	2,274	6.0%
Corkscrew Road, west of I-75 SB Ramps	42,589	1,616	3.8%	234	0.5%	1,850	4.3%
Stoneybrook Golf Boulevard, south of Corkscrew	7,669	248	3.2%	21	0.3%	269	3.5%

**Table 2.7** summarizes the historical AADT and T<sub>24</sub> factors for classification counts in the study area found on Florida Traffic Online (FTO).

Table 2.7: Historical AADT and T<sub>24</sub> Factors

Location	COSITE	2017		2018		2019	
		AADT	T <sub>24</sub>	AADT	T <sub>24</sub>	AADT	T <sub>24</sub>
NB Off Ramp	127011	9500	9.9	10000	9.7	10500	10.3
NB On Ramp	127013	9500	9.9	10500	9.7	11000	10.3
SB Off Ramp	127014	9500	9.9	10500	9.7	11000	10.3
SB On Ramp	127012	10000	9.9	11000	9.7	11500	10.3
Corkscrew Road, east of I-75	124249	32000	4.1	33000	7	39000	3.9
Three Oaks Parkway, south of Corkscrew Road	124525	17600	3.6	23500	4.7	29500	3.7

To develop design truck factors for the study area Florida Traffic Online and the 72-hour classification count were reviewed for each major segment group within the study area. If a 72-hour classification count is available it was used, otherwise Florida Traffic Online was used. **Table 2.8** provides the  $T_{24}$  and design hourly truck factor (DHT) for each of these locations.

**Table 2.8: Design Truck Factors**

Location	Count Site	$T_{24}$	DHT
I-75 Ramps	FTO count	10.3	6
Cross Street	72-hour classification count	6.0	3
Side Streets	72-hour classification count	3.5	2

## 1.0 Traffic Data Collection

Traffic counts were collected by FTE, Inc. during February, and March 2019. There were two 72-hour bi-directional classification count, eleven 72-hour bi-directional volume counts, and sixteen turning movement counts (TMCs) collected between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. **Table 1.1** provides a list of all data collection efforts. An analysis of these counts indicates the AM peak hour occurred between 7:15 AM and 8:15 AM and the PM peak hour occurred between 4:45 PM and 5:45 PM.

**Table 1.1: Traffic Data Collection**

## 2.0 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the Existing Year (2019) design traffic volumes for the interchange study area. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*.

### 2.1 Field Collected AADT

Existing Year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the three-day average of the 72-hour count data by seasonal and axle adjustment factors. Seasonal and axle correction factors were downloaded from Florida Traffic Online, prior to the release of the 2019 data. A comparison of the 2018 seasonal and axle correction factors to the recently released 2019 data indicates only minimal differences and so the 2018 correction factors were not updated to 2019. **Table 2.1** summarizes the field collected Existing Year (2019) AADT volumes.

**Table 2.1: Field Collected Existing Year (2019) AADT**

Location	2019 Count	Seasonal Factor	Axle Factor	2019 AADT	2019 AADT (Rounded)**
<b>I-75 Ramps</b>					
Southbound Off-Ramp	12,970	0.89	0.99	11,428	11,500
Southbound On-Ramp	13,056	0.89	0.99	11,504	11,500
Northbound Off-Ramp	7,968	0.89	0.99	7,021	7,000
Northbound On-Ramp	12,939	0.89	0.99	11,401	11,500
<b>Along Cross Street</b>					
Bonita Beach Road, east of Bonita Grande Drive	17,913	0.89	N/A	15,943	16,000
Bonita Beach Road, east of Imperial Parkway	49,116	0.89	N/A	43,713	43,500
Bonita Beach Road, west of Lime Street	45,898	0.89	0.99	40,441	40,500
Bonita Beach Road, west of I-75 SB Ramps	48,642	0.89	0.99	42,858	43,000
Bonita Beach Road, east of I-75 NB Ramps	23,952	0.89	0.99	21,104	21,000
<b>Along Side Streets</b>					
Bonita Grande Drive, south of Bonita Beach Road	8,398	0.89	0.99	7,399	7,400
Bonita Grande Drive, north of Bonita Beach Road	8,231	0.89	0.99	7,252	7,300
Imperial Parkway, north of Bonita Beach Road	28,718	0.89	0.99	25,303	25,500
Imperial Parkway south Bonita Beach Road	23,242	0.89	0.99	20,479	20,500

\*This count was a vehicle classification count.

\*\*AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

### 2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the Existing Year (2019), Opening Year (2025), and Design Year (2040) design traffic volumes.

2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured at each intersection within the study area was used for the Existing Year (2019) for the AM and PM peak hours. **Table 2.2** summarizes the existing AM and PM PHFs for the 16 intersections in the study area. During the AM peak hour, the PHF ranges from 0.90 to 0.97 with a weighted average of 0.93. During the PM peak hour, the PHF ranges from 0.89 to 0.99 with a weighted average of 0.95.

**Table 2.2: Field Measured Peak Hour Factors**

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
Bonita Beach Road and Trade Way One	0.92	0.97
Bonita Beach Road and Trade Way Two	0.90	0.94
Bonita Beach Road and Trade Way Three	0.90	0.95
Bonita Beach Road and Bonita Grande Drive	0.90	0.95
Imperial Parkway and Dean Street	0.97	0.98
Bonita Grande Drive and Trade Way Four	0.93	0.92
Bonita Grande Drive and Trade Way Drive	0.90	0.89
Bonita Beach Road and Lime Street	0.92	0.94
Bonita Beach Road and Duck Lake Loop	0.90	0.95
Bonita Beach Road and Imperial Parkway	0.94	0.98
Bonita Beach Road and Quinn Street	0.96	0.95
Bonita Beach Road and Downs Drive	0.96	0.99
Bonita Beach Road and Oakland Drive	0.97	0.97
Bonita Beach Road and I-75 SB Ramps	0.96	0.96
Bonita Beach Road and I-75 NB Ramps	0.95	0.96
Bonita Beach Road and Miller Road/Hunters Ridge Boulevard	0.91	0.95
<b>Average</b>	<b>0.93</b>	<b>0.95</b>

However, a PHF of 0.95 is recommended for Opening Year (2025) and Design Year (2040) analysis.

2.2.2 Peak to Daily Ratio

The peak to daily ratio (PTD) represents the proportion of AADT occurring during the design hour. **Table 2.3** summarizes the PTD that occurred during the AM and PM peak hours. The weighted average of the AM PTD is 7.2 percent. The weighted average of the PM PTD is 7.8 percent. Based on the FDOT’s *Project Traffic Forecasting Handbook (2019)*, a standard PTD of 9.0 percent is used for arterials in an urban area. The slightly lower PTD observed during the data collection would indicate some amount of congestion and possibly peak spreading. The PTD listed in **Table 2.3** was used in the development of exiting traffic volumes but the standard PTD of 9.0 percent will be used for the future traffic.

Table 2.3: Field Measured Peak to Daily Ratio

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	PTD	Volume	PTD
<b>I-75 Ramps</b>					
Southbound Off-Ramp	11,428	918	8.0%	663	5.8%
Southbound On-Ramp	11,504	851	7.4%	910	7.9%
Northbound Off-Ramp	7,021	970	13.8%	691	9.8%

Bonita Beach Road, east of Imperial Parkway	43,713	3,024	6.9%	3,340	7.6%
Bonita Beach Road, west of Lime Street	40,441	2,707	6.7%	2,892	7.2%
Bonita Beach Road, west of I-75 SB Ramps	42,858	2,892	6.7%	3,037	7.1%
Bonita Beach Road, east of I-75 NB Ramps	21,104	1,432	6.8%	1,553	7.4%
<b>Along Side Streets</b>					
Bonita Grande Drive, south of Bonita Beach Road	7,399	365	4.9%	528	7.1%
Bonita Grande Drive, north of Bonita Beach Road	7,252	631	8.7%	583	8.0%
Imperial Parkway, north of Bonita Beach Road	25,303	2,072	8.2%	2,396	9.5%
Imperial Parkway south Bonita Beach Road	20,479	1,786	8.7%	1,878	9.2%

2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was calculated from the 72-hour bi-directional approach counts for each counted location within the study area. **Tables 2.5** and **2.6** summarize the AM and PM peak hour directional distribution percentages (D factors) for this interchange. The D factor ranged from 57.5 percent to 64.6 percent during the AM peak hour along the cross street, with a peak direction of west throughout. During the PM peak hour, the D factor ranged from 51.8 percent to 63.7 percent with an east peak direction.

Table 2.4: Field Measured D Factors – AM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
<b>Along Cross Street</b>					
Bonita Beach Road, east of Bonita Grande Drive	333	627	65.3%	64.6%	West
Bonita Beach Road, east of Imperial Parkway	1,281	1,743	57.6%	59.0%	West
Bonita Beach Road, west of Lime Street	1,046	1,661	61.4%	62.4%	West
Bonita Beach Road, west of I-75 SB Ramps	1,182	1,710	59.1%	61.4%	West
Bonita Beach Road, east of I-75 NB Ramps	639	793	55.4%	57.5%	West
<b>Along Side Streets</b>					
Bonita Grande Drive, south of Bonita Beach Road	138	227	62.2%	64.6%	South
Bonita Grande Drive, north of Bonita Beach Road	203	428	67.8%	64.7%	South
Imperial Parkway, north of Bonita Beach Road	1,368	704	66.0%	65.0%	North

## Bonita Beach Road

Imperial Parkway south Bonita Beach Road	702	1,084	60.7%	61.8%	South
--	-----	-------	-------	-------	-------

\*Resulting D Factor after volume balancing procedures were conducted.

**Table 2.5: Field Measured D Factors – PM Peak Hour**

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
<b>Along Cross Street</b>					
Bonita Beach Road, east of Bonita Grande Drive	629	584	51.9%	51.9%	East
Bonita Beach Road, east of Imperial Parkway	1,936	1,404	58.0%	58.7%	East
Bonita Beach Road, west of Lime Street	1,806	1,086	62.4%	63.7%	East
Bonita Beach Road, west of I-75 SB Ramps	1,745	1,292	57.5%	58.3%	East
Bonita Beach Road, east of I-75 NB Ramps	740	813	52.4%	51.8%	West
<b>Along Side Streets</b>					
Bonita Grande Drive, south of Bonita Beach Road	335	193	63.4%	63.2%	North
Bonita Grande Drive, north of Bonita Beach Road	309	274	53.0%	53.1%	North
Imperial Parkway, north of Bonita Beach Road	1,030	1,366	57.0%	60.9%	South
Imperial Parkway south Bonita Beach Road	1,028	850	54.7%	56.2%	North

\*Resulting D Factor after volume balancing procedures were conducted.

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceed the recommended D factors defined in the FDOT's *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 64.6 percent was used.

### 2.2.4 Daily and Design Hour Truck Factors

The daily truck ( $T_{24}$ ) factor is the percentage of medium and heavy truck traffic in a 24-hour period. **Table 2.6** summarizes the classification counts collected as a part of this study effort. These counts were collected during February and March 2019.

**Table 2.6: Field Measured Daily Vehicle Composition**

Location	Total Vehicles	Medium Trucks		Heavy Trucks		Total Trucks ( $T_{24}$ )	
		Count	%	Count	%	Count	%
Bonita Beach Road, east of Bonita Grande Drive	16,843	803	4.8%	87	0.5%	890	5.3%
Bonita Beach Road, east of Imperial Parkway	47,116	2,596	5.5%	529	1.1%	3,125	6.6%

**Table 2.7** summarizes the historical AADT and  $T_{24}$  factors for classification counts in the study area found on Florida Traffic Online (FTO).

**Table 2.7: Historical AADT and  $T_{24}$  Factors**

Location	COSITE	2017		2018		2019	
		AADT	$T_{24}$	AADT	$T_{24}$	AADT	$T_{24}$
NB Off Ramp	127001	11500	9.9	11000	9.7	11500	10.3
NB On Ramp	127003	11500	9.9	11500	9.7	12000	10.3

## Bonita Beach Road

SB Off Ramp	127004	10500	9.9	11500	9.7	12000	10.3
SB On Ramp	127002	12000	9.9	11500	9.7	12000	10.3
Bonita Beach Road, east of Bonita Grande Drive	124903	10700	3.6	12200	6.7	12500	4.2
Imperial Street, south of Bonita Beach	124492	20300	3.6	20400	6.1	21000	5

To develop design truck factors for the study area Florida Traffic Online and the 72-hour classification count were reviewed for each major segment group within the study area. If a 72-hour classification count is available it was used, otherwise Florida Traffic Online was used. **Table 2.8** provides the  $T_{24}$  and design hourly truck factor (DHT) for each of these locations.

**Table 2.8: Design Truck Factors**

Location	Count Site	$T_{24}$	DHT
I-75 Ramps	FTO count	10.3	6
Cross Street	72-hour classification count	6.6	4
Side Streets	124492	5	3

## 1.0 Traffic Data Collection

Traffic counts were collected by FTE, Inc. during February, and March 2019. There were three 72-hour bi-directional classification count, eleven 72-hour bi-directional volume counts, and twelve turning movement counts (TMCs) collected between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. **Table 1.1** provides a list of all data collection efforts. An analysis of these counts indicates the AM peak hour occurred between 7:15 AM and 8:15 AM and the PM peak hour occurred between 4:45 PM and 5:45 PM.

**Table 1.1: Traffic Data Collection**

## 2.0 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the Existing Year (2019) design traffic volumes for the interchange study area. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*.

### 2.1 Field Collected AADT

Existing Year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the three-day average of the 72-hour count data by seasonal and axle adjustment factors. Seasonal and axle correction factors were downloaded from Florida Traffic Online, prior to the release of the 2019 data. A comparison of the 2018 seasonal and axle correction factors to the recently released 2019 data indicates only minimal differences and so the 2018 correction factors were not updated to 2019. **Table 2.1** summarizes the field collected Existing Year (2019) AADT volumes.

**Table 2.1: Field Collected Existing Year (2019) AADT**

Location	2019 Count	Seasonal Factor	Axle Factor	2019 AADT	2019 AADT (Rounded)**
<b>I-75 Ramps</b>					
Southbound Off-Ramp	22,117	0.87	0.96	18,472	18,500
Southbound On-Ramp	11,157	0.87	0.96	9,318	9,300
Northbound Off-Ramp	9,981	0.87	0.96	8,336	8,300
Northbound On-Ramp	20,967	0.87	0.96	17,512	17,500
<b>Along Cross Street</b>					
Immokalee Road, east of Livingston Road	69,125	0.87	N/A	60,139	60,000
Immokalee Road, west of I-75 SB Ramps	65,832	0.87	N/A	57,274	57,500
Immokalee Road, east of Valewood Drive	51,772	0.87	N/A	45,042	45,000
Immokalee Road, west of Livingston Road	54,005	0.87	0.96	45,105	45,000
Immokalee Road, east of Logan Boulevard	50,772	0.87	0.96	42,405	42,500
Immokalee Road, east of I-75 NB Ramps	62,989	0.87	0.96	52,608	52,500
<b>Along Side Streets</b>					
Logan Boulevard, south of Immokalee Road	12,934	0.87	0.96	10,802	11,000
Livingston Road, north of Immokalee Road	30,292	0.87	0.96	25,300	25,500
Livingston Road, south of Immokalee Road	31,202	0.87	0.96	26,060	26,000
Logan Boulevard, north of Immokalee Road	9,792	0.87	0.96	8,178	8,200

\*This count was a vehicle classification count.

\*\*AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

### 2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the Existing Year (2019), Opening Year (2025), and Design Year (2040) design traffic volumes.

2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured at each intersection within the study area was used for the Existing Year (2019) for the AM and PM peak hours. **Table 2.2** summarizes the existing AM and PM PHFs for the 12 intersections in the study area. During the AM peak hour, the PHF ranges from 0.81 to 0.96 with a weighted average of 0.91. During the PM peak hour, the PHF ranges from 0.87 to 0.98 with a weighted average of 0.95.

**Table 2.2: Field Measured Peak Hour Factors**

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
Livingston Road and Carlton Lakes Boulevard	0.81	0.95
Juliet Boulevard and Useppa Way	0.88	0.87
Immokalee Road and Logan Boulevard	0.96	0.96
Immokalee Road and Lakeland Avenue	0.87	0.93
Immokalee Road and Aston Drive	0.90	0.95
Immokalee Road and Livingston Road	0.92	0.98
Immokalee Road and Juliet Boulevard	0.91	0.96
Immokalee Road and I-75 SB Ramps	0.95	0.98
Immokalee Road and I-75 NB Ramps	0.92	0.97
Immokalee Road and Northbrooke Drive/Tarpon Bay Boulevard	0.91	0.98
Immokalee Road and Oakes Boulevard	0.96	0.96
Immokalee Road and Valewood Drive	0.96	0.95
<b>Average</b>	<b>0.91</b>	<b>0.95</b>

However, a PHF of 0.95 is recommended for Opening Year (2025) and Design Year (2040) analysis.

2.2.2 Peak to Daily Ratio

The peak to daily ratio (PTD) represents the proportion of AADT occurring during the design hour. **Table 2.3** summarizes the PTD that occurred during the AM and PM peak hours. The weighted average of the AM PTD is 6.9 percent. The weighted average of the PM PTD is 7.5 percent. Based on the FDOT’s *Project Traffic Forecasting Handbook (2019)*, a standard PTD of 9.0 percent is used for arterials in an urban area. The slightly lower PTD observed during the data collection would indicate some amount of congestion and possibly peak spreading. The PTD listed in **Table 2.3** was used in the development of exiting traffic volumes but the standard PTD of 9.0 percent will be used for the future traffic.

Table 2.3: Field Measured Peak to Daily Ratio

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	PTD	Volume	PTD
<b>I-75 Ramps</b>					
Southbound Off-Ramp	18,472	1,281	6.9%	1,242	6.7%
Southbound On-Ramp	9,318	763	8.2%	602	6.5%
Northbound Off-Ramp	8,336	603	7.2%	616	7.4%
Northbound On-Ramp	17,512	1,199	6.8%	975	5.6%
<b>Along Cross Street</b>					
Immokalee Road, east of Livingston Road	60,139	3,590	6.0%	4,231	7.0%
Immokalee Road, west of I-75 SB Ramps	57,274	3,249	5.7%	4,064	7.1%
Immokalee Road, east of Valewood Drive	45,042	3,533	7.8%	3,593	8.0%
Immokalee Road, west of Livingston Road	45,105	3,055	6.8%	3,466	7.7%
Immokalee Road, east of Logan Boulevard	42,405	3,127	7.4%	3,323	7.8%
Immokalee Road, east of I-75 NB Ramps	52,608	3,607	6.9%	3,853	7.3%
<b>Along Side Streets</b>					
Logan Boulevard, south of Immokalee Road	10,802	746	6.9%	954	8.8%
Livingston Road, north of Immokalee Road	25,300	2,142	8.5%	2,363	9.3%
Livingston Road, south of Immokalee Road	26,060	1,918	7.4%	2,211	8.5%
Logan Boulevard, north of Immokalee Road	8,178	590	7.2%	628	7.7%

2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was calculated from the 72-hour bi-directional approach counts for each counted location within the study area. **Tables 2.5** and **2.6** summarize the AM and PM peak hour directional distribution percentages (D factors) for this interchange. The D factor ranged from 64.7 percent to 66.8 percent during the AM peak hour along the cross street, with a peak direction of west throughout. During the PM peak hour, the D factor ranged from 57.8 percent to 66.8 percent with an east peak direction.

Table 2.4: Field Measured D Factors – AM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
<b>Along Cross Street</b>					
Immokalee Road, east of Livingston Road	1,351	2,239	62.4%	65.5%	West
Immokalee Road, west of I-75 SB Ramps	1,252	1,997	61.5%	64.9%	West
Immokalee Road, east of Valewood Drive	1,222	2,311	65.4%	66.8%	West
Immokalee Road, west of Livingston Road	1,070	1,985	65.0%	66.0%	West
Immokalee Road, east of Logan Boulevard	1,054	2,073	66.3%	66.0%	West
Immokalee Road, east of I-75 NB Ramps	1,351	2,256	62.5%	64.7%	West
<b>Along Side Streets</b>					
Logan Boulevard, south of Immokalee Road	330	416	55.8%	62.5%	South
Livingston Road, north of Immokalee Road	879	1,263	59.0%	56.1%	South
Livingston Road, south of Immokalee Road	842	1,076	56.1%	56.5%	South
Logan Boulevard, north of Immokalee Road	191	399	67.6%	69.4%	South

\*Resulting D Factor after volume balancing procedures were conducted.

**Table 2.5: Field Measured D Factors – PM Peak Hour**

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
<b>Along Cross Street</b>					
Immokalee Road, east of Livingston Road	2,304	1,927	54.5%	57.8%	East
Immokalee Road, west of I-75 SB Ramps	2,282	1,782	56.2%	59.9%	East
Immokalee Road, east of Valewood Drive	2,313	1,280	64.4%	66.5%	East
Immokalee Road, west of Livingston Road	2,046	1,420	59.0%	58.4%	East
Immokalee Road, east of Logan Boulevard	2,175	1,148	65.5%	66.8%	East
Immokalee Road, east of I-75 NB Ramps	2,417	1,436	62.7%	62.9%	East
<b>Along Side Streets</b>					
Logan Boulevard, south of Immokalee Road	535	419	56.1%	55.9%	North
Livingston Road, north of Immokalee Road	1,401	962	59.3%	56.6%	North
Livingston Road, south of Immokalee Road	1,297	914	58.7%	56.8%	North
Logan Boulevard, north of Immokalee Road	354	274	56.4%	59.8%	North

\*Resulting D Factor after volume balancing procedures were conducted.

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceed the recommended D factors defined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 66.8 percent was used.

2.2.4 Daily and Design Hour Truck Factors

The daily truck ( $T_{24}$ ) factor is the percentage of medium and heavy truck traffic in a 24-hour period. **Table 2.6** summarizes the classification counts collected as a part of this study effort. These counts were collected during February and March 2019.

**Table 2.6: Field Measured Daily Vehicle Composition**

Location	Total Vehicles	Medium Trucks		Heavy Trucks		Total Trucks ( $T_{24}$ )	
		Count	%	Count	%	Count	%
Immokalee Road, east of Livingston Road	58,166	2,540	4.4%	731	1.3%	3,271	5.6%
Immokalee Road, west of I-75 SB Ramps	55,286	2,289	4.1%	454	0.8%	2,743	5.0%
Immokalee Road, east of Valewood Drive	50,249	2,352	4.7%	321	0.6%	2,673	5.3%

**Table 2.7** summarizes the historical AADT and  $T_{24}$  factors for classification counts in the study area found on Florida Traffic Online (FTO).

**Table 2.7: Historical AADT and  $T_{24}$  Factors**

Location	COSITE	2017		2018		2019

Livingstone Road, south of Immokalee Road	34597	27000	3.8	25500	5.4	28500	4
---	-------	-------	-----	-------	-----	-------	---

To develop design truck factors for the study area Florida Traffic Online and the 72-hour classification count were reviewed for each major segment group within the study area. If a 72-hour classification count is available it was used, otherwise Florida Traffic Online was used. **Table 2.8** provides the  $T_{24}$  and design hourly truck factor (DHT) for each of these locations.

**Table 2.8: Design Truck Factors**

Location	Count Site	$T_{24}$	DHT
I-75 Ramps	FTO count	7.5	4
Cross Street	72-hour classification count	5.6	3
Side Streets	34597	4	2

# 1.0 Traffic Data Collection

Traffic counts were collected by FTE, Inc. during February, and March 2019. There were two 72-hour bi-directional classification count, seven 72-hour bi-directional volume counts, and six turning movement counts (TMCs) collected between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. **Table 1.1** provides a list of all data collection efforts. An analysis of these counts indicates the AM peak hour occurred between 7:15 AM and 8:15 AM and the PM peak hour occurred between 4:45 PM and 5:45 PM.

**Table 1.1: Traffic Data Collection**

## 2.0 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the Existing Year (2019) design traffic volumes for the interchange study area. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*.

### 2.1 Field Collected AADT

Existing Year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the three-day average of the 72-hour count data by seasonal and axle adjustment factors. Seasonal and axle correction factors were downloaded from Florida Traffic Online, prior to the release of the 2019 data. A comparison of the 2018 seasonal and axle correction factors to the recently released 2019 data indicates only minimal differences and so the 2018 correction factors were not updated to 2019. **Table 2.1** summarizes the field collected Existing Year (2019) AADT volumes.

**Table 2.1: Field Collected Existing Year (2019) AADT**

Location	2019 Count	Seasonal Factor	Axle Factor	2019 AADT	2019 AADT (Rounded)**
<b>Along Cross Street</b>					
Vanderbilt Beach Road, east of Livingston	49,428	0.87	N/A	43,002	43,000
Vanderbilt Beach Road, east of Vineyard Road	38,937	0.87	N/A	33,875	34,000
Vanderbilt Beach Road, west of Livingston	44,766	0.87	0.98	38,167	38,000
Vanderbilt Beach Road, west of I-75	42,283	0.87	0.98	36,050	36,000
Vanderbilt Beach Road, east of Logan Boulevard	33,919	0.87	0.98	28,919	29,000
<b>Along Side Streets</b>					
Livingston Road, north of Vanderbilt Beach	29,766	0.87	0.98	25,378	25,500
Livingston Road, south of Vanderbilt Beach	36,301	0.87	0.98	30,950	31,000
Logan Boulevard, north of Vanderbilt Beach Road	12,650	0.87	0.98	10,785	11,000
Logan Boulevard, south of Vanderbilt Beach	11,706	0.87	0.98	9,981	10,000

\*This count was a vehicle classification count.

\*\*AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

### 2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the Existing Year (2019), Opening Year (2025), and Design Year (2040) design traffic volumes.

#### 2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured at each intersection within the study area was used for the Existing Year (2019) for the AM and PM peak hours. **Table 2.2** summarizes the existing AM and PM PHFs for the 6 intersections in the study area. During the AM peak hour, the PHF ranges from 0.90 to 0.93 with a weighted average of 0.92. During the PM peak hour, the PHF ranges from 0.94 to 0.99 with a weighted average of 0.97.

Table 2.2: Field Measured Peak Hour Factors

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
Vanderbilt Beach Road and Livingston Road	0.93	0.98
Vanderbilt Beach Road and Bermuda Isle Cir	0.93	0.98
Vanderbilt Beach Road and Wilshire Lakes Boulevard	0.90	0.94
Vanderbilt Beach Road and Oakes Boulevard	0.90	0.97
Vanderbilt Beach Road and Vineyards Boulevard	0.90	0.94
Vanderbilt Beach Road and Logan Boulevard	0.95	0.99
<b>Average</b>	<b>0.92</b>	<b>0.97</b>

However, a PHF of 0.97 is recommended for Opening Year (2025) and Design Year (2040) analysis.

2.2.2 Peak to Daily Ratio

The peak to daily ratio (PTD) represents the proportion of AADT occurring during the design hour. **Table 2.3** summarizes the PTD that occurred during the AM and PM peak hours. The weighted average of the AM PTD is 7.7 percent. The weighted average of the PM PTD is 9.4 percent. Based on the FDOT’s *Project Traffic Forecasting Handbook (2019)*, a standard PTD of 9.0 percent is used for arterials in an urban area. The slightly lower PTD in the AM observed during the data collection would indicate some amount of congestion and possibly peak spreading. The PTD listed in **Table 2.3** was used in the development of exiting traffic volumes but the standard PTD of 9.0 percent will be used for the future traffic.

## Vanderbilt Beach Road

**Table 2.3: Field Measured Peak to Daily Ratio**

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	PTD	Volume	PTD
<b>Along Cross Street</b>					
Vanderbilt Beach Road, east of Livingston	43,002	3,266	7.6%	4,100	9.5%
Vanderbilt Beach Road, east of Vineyard Road	33,875	2,510	7.4%	3,294	9.7%
Vanderbilt Beach Road, west of Livingston	38,167	2,578	6.8%	3,613	9.5%
Vanderbilt Beach Road, west of I-75	36,050	3,044	8.4%	3,486	9.7%
Vanderbilt Beach Road, east of Logan Boulevard	28,919	2,395	8.3%	2,719	9.4%
<b>Along Side Streets</b>					
Livingston Road, north of Vanderbilt Beach	25,378	1,944	7.7%	2,176	8.6%
Livingston Road, south of Vanderbilt Beach	30,950	2,508	8.1%	2,634	8.5%
Logan Boulevard, north of Vanderbilt Beach Road	10,785	790	7.3%	1,022	9.5%
Logan Boulevard, south of Vanderbilt Beach	9,981	813	8.1%	993	9.9%

### 2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was calculated from the 72-hour bi-directional approach counts for each counted location within the study area. **Tables 2.5** and **2.6** summarize the AM and PM peak hour directional distribution percentages (D factors) for this interchange. The D factor ranged from 75.6 percent to 80.8 percent during the AM peak hour along the cross street, with a peak direction of west throughout. During the PM peak hour, the D factors are not quite as extreme on the cross street, but still high with an east peak direction.

**Table 2.4: Field Measured D Factors – AM Peak Hour**

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
<b>Along Cross Street</b>					
Vanderbilt Beach Road, east of Livingston	693	2,573	78.8%	80.0%	West
Vanderbilt Beach Road, east of Vineyard Road	578	1,932	77.0%	80.8%	West
Vanderbilt Beach Road, west of Livingston	639	1,939	75.2%	75.6%	West
Vanderbilt Beach Road, west of I-75	638	2,406	79.0%	78.4%	West
Vanderbilt Beach Road, east of Logan Boulevard	510	1,885	78.7%	79.7%	West
<b>Along Side Streets</b>					
Livingston Road, north of Vanderbilt Beach	829	1,115	57.4%	54.2%	South
Livingston Road, south of Vanderbilt Beach	894	1,614	64.4%	52.2%	South
Logan Boulevard, north of Vanderbilt Beach Road	265	525	66.5%	66.8%	South
Logan Boulevard, south of Vanderbilt Beach	446	367	54.9%	56.1%	North

\*Resulting D Factor after volume balancing procedures were conducted.

**Table 2.5: Field Measured D Factors – PM Peak Hour**

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
----------	------------------------------------	------------------------------------	---------------------------	-----------------------	-------------------

## Vanderbilt Beach Road

<b>Along Cross Street</b>					
Vanderbilt Beach Road, east of Livingston	2,739	1,361	66.8%	64.9%	East
Vanderbilt Beach Road, east of Vineyard Road	2,320	974	70.4%	66.2%	East
Vanderbilt Beach Road, west of Livingston	2,257	1,356	62.5%	62.2%	East
Vanderbilt Beach Road, west of I-75	2,240	1,246	64.3%	64.2%	East
Vanderbilt Beach Road, east of Logan Boulevard	1,771	948	65.1%	65.7%	East
<b>Along Side Streets</b>					
Livingston Road, north of Vanderbilt Beach	1,237	939	56.8%	59.4%	North
Livingston Road, south of Vanderbilt Beach	1,646	988	62.5%	57.7%	North
Logan Boulevard, north of Vanderbilt Beach Road	581	441	56.8%	57.9%	North
Logan Boulevard, south of Vanderbilt Beach	495	498	50.2%	51.6%	South

\*Resulting D Factor after volume balancing procedures were conducted.

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceed the recommended D factors defined in the FDOT's *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 80.8 percent was used.

### 2.2.4 Daily and Design Hour Truck Factors

The daily truck ( $T_{24}$ ) factor is the percentage of medium and heavy truck traffic in a 24-hour period. **Table 2.6** summarizes the classification counts collected as a part of this study effort. These counts were collected during February and March 2019.

**Table 2.6: Field Measured Daily Vehicle Composition**

Location	Total Vehicles	Medium Trucks		Heavy Trucks		Total Trucks ( $T_{24}$ )	
		Count	%	Count	%	Count	%
Vanderbilt Beach Road, east of Livingston	44,635	1,732	3.9%	90	0.2%	1,822	4.1%
Vanderbilt Beach Road, east of Vineyard Road	33,375	1,296	3.9%	327	1.0%	1,623	4.9%

**Table 2.7** summarizes the historical AADT and  $T_{24}$  factors for classification counts in the study area found on Florida Traffic Online (FTO).

**Table 2.7: Historical AADT and  $T_{24}$  Factors**

Location	COSITE	2017		2018		2019	
		AADT	$T_{24}$	AADT	$T_{24}$	AADT	$T_{24}$
Livingstone Road, south of Vanderbilt Beach Road	34576	30500	3.8	30500	4.7	33500	4.2

To develop design truck factors for the study area Florida Traffic Online and the 72-hour classification count were reviewed for each major segment group within the study area. If a 72-hour classification count is available it was used, otherwise Florida Traffic Online was used. **Table 2.8** provides the  $T_{24}$  and design hourly truck factor (DHT) for each of these locations.

Vanderbilt Beach Road

Table 2.8: Design Truck Factors

Location	Count Site	T <sub>24</sub>	DHT
Cross Street	72-hour classification count	4.9	3
Side Streets	34576	4.2	3

## 1.0 Traffic Data Collection

Traffic counts were collected by FTE, Inc. during February, and March 2019. There was one 72-hour bi-directional classification count, fourteen 72-hour bi-directional volume counts, and thirteen turning movement counts (TMCs) collected between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. **Table 1.1** provides a list of all data collection efforts. An analysis of these counts indicates the AM peak hour occurred between 7:15 AM and 8:15 AM and the PM peak hour occurred between 4:45 PM and 5:45 PM.

**Table 1.1: Traffic Data Collection**

## 2.0 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the Existing Year (2019) design traffic volumes for the interchange study area. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*.

### 2.1 Field Collected AADT

Existing Year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the three-day average of the 72-hour count data by seasonal and axle adjustment factors. Seasonal and axle correction factors were downloaded from Florida Traffic Online, prior to the release of the 2019 data. A comparison of the 2018 seasonal and axle correction factors to the recently released 2019 data indicates only minimal differences and so the 2018 correction factors were not updated to 2019. **Table 2.1** summarizes the field collected Existing Year (2019) AADT volumes.

**Table 2.1: Field Collected Existing Year (2019) AADT**

Location	2019 Count	Seasonal Factor	Axle Factor	2019 AADT	2019 AADT (Rounded)**
<b>I-75 Ramps</b>					
Southbound On-Ramp	7,888	0.86	0.98	6,648	6,600
Southbound Off-Ramp	13,053	0.86	0.98	11,001	11,000
Northbound On-Ramp	12,186	0.86	0.98	10,270	10,500
Northbound Off-Ramp	6,667	0.86	0.98	5,619	5,600
<b>Along Cross Street</b>					
West of Livingston Road	54,531	0.86	0.98	45,959	46,000
West of I-75 Southbound Ramps	56,393	0.86	0.98	47,528	47,500
East of I-75 Northbound Ramps	43,993	0.86	0.98	37,077	37,000
West of Logan Boulevard*	40,222	0.86	N/A	34,591	34,500
East of Logan Boulevard	24,158	0.86	0.98	20,360	20,500
<b>Along Side Streets</b>					
Meridian Plaza, east of Livingston Road	1,555	0.86	0.98	1,311	1,300
Livingston Road, north of Pine Ridge Road	31,107	0.86	0.98	26,217	26,000
Livingston Road, south of Pine Ridge Road	31,153	0.86	0.98	26,256	26,500
Whippoorwill Lane, south of Pine Ridge Road	14,992	0.86	0.98	12,635	12,500
Logan Boulevard, north of Pine Ridge Road	13,742	0.86	0.98	11,852	11,500
Logan Boulevard, south of Pine Ridge Road	30,195	0.86	0.98	25,448	25,500

\*This count was a vehicle classification count.

\*\*AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

### 2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the Existing Year (2019), Opening Year (2025), and Design Year (2040) design traffic volumes.

2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured at each intersection within the study area was used for the Existing Year (2019) for the AM and PM peak hours. **Table 2.2** summarizes the existing AM and PM PHFs for the 13 intersections in the study area. During the AM peak hour, the PHF ranges from 0.82 to 0.95 with a weighted average of 0.92. During the PM peak hour, the PHF ranges from 0.91 to 0.98 with a weighted average of 0.95.

**Table 2.2: Field Measured Peak Hour Factors**

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
Pine Ridge Road and Vineyards Boulevard	0.95	0.98
Pine Ridge Road and Logan Boulevard	0.93	0.98
Livingston Road and Uniforms Unlimited	0.88	0.95
Whippoorwill Ln and Dudley Drive	0.82	0.91
Pine Ridge Road and Livingston Road	0.92	0.97
Pine Ridge Road and Starbucks	0.95	0.93
Pine Ridge Road at Meridian Mall Entrance	0.94	0.94
Pine Ridge Road and Kraft Road	0.92	0.92
Pine Ridge Road and Whippoorwill Ln	0.93	0.93
Pine Ridge Road at Larson Way	0.94	0.94
Pine Ridge Road and I-75 SB Ramps	0.92	0.97
Pine Ridge Road and I-75 NB Ramps	0.93	0.96
Pine Ridge Road and Napa Boulevard	0.94	0.97
<b>Average</b>	<b>0.92</b>	<b>0.95</b>

However, a PHF of 0.95 is recommended for Opening Year (2025) and Design Year (2040) analysis.

2.2.2 Peak to Daily Ratio

The peak to daily ratio (PTD) represents the proportion of AADT occurring during the design hour. **Table 2.3** summarizes the PTD that occurred during the AM and PM peak hours. The weighted average of the AM PTD is 7.6 percent. The weighted average of the PM PTD is 8.8 percent. Based on the FDOT's *Project Traffic Forecasting Handbook (2019)*, a standard PTD of 9.0 percent is used for arterials in an urban area. The slightly lower PTD observed during the data collection would indicate some amount of congestion and possibly peak spreading. The PTD listed in **Table 2.3** was used in the development of exiting traffic volumes but the standard PTD of 9.0 percent will be used for the future traffic.

Table 2.3: Field Measured Peak to Daily Ratio

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	PTD	Volume	PTD
<b>I-75 Ramps</b>					
Southbound On-Ramp	6,648	507	7.6%	488	7.3%
Southbound Off-Ramp	11,001	754	6.9%	784	7.1%
Northbound On-Ramp	10,270	653	6.4%	774	7.5%
Northbound Off-Ramp	5,619	441	7.8%	490	8.7%
<b>Along Cross Street</b>					
West of Livingston Road	45,959	2688	5.8%	3,508	7.6%
West of I-75 Southbound Ramps	47,528	3339	7.0%	3,792	8.0%
East of I-75 Northbound Ramps	37,077	2870	7.7%	3,085	8.3%
West of Logan Boulevard	34,591	2913	8.4%	2,936	8.5%
East of Logan Boulevard	20,360	1837	9.0%	1,712	8.4%
<b>Along Side Streets</b>					
Meridian Plaza, east of Livingston Road	1,311	142	10.8%	119	9.1%
Livingston Road, north of Pine Ridge Road	26,217	2192	8.4%	2,203	8.4%
Livingston Road, south of Pine Ridge Road	26,256	2171	8.9%	2,260	8.6%
Whippoorwill Lane, south of Pine Ridge Road	12,635	853	6.8%	993	7.9%
Logan Boulevard, north of Pine Ridge Road	11,582	921	8.0%	1,095	9.5%
Logan Boulevard, south of Pine Ridge Road	25,448	2083	8.2%	2,307	9.1%

2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was calculated from the 72-hour bi-directional approach counts for each counted location within the study area. **Tables 2.5** and **2.6** summarize the AM and PM peak hour directional distribution percentages (D factors) for this interchange. The D factor ranged from 67.3 percent to 76.6 percent during the AM peak hour along the cross street, with a peak direction of west throughout. During the PM peak hour the D factors are not quite as extreme on the cross street, but still high with an east peak direction.

Table 2.4: Field Measured D Factors – AM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
<b>Along Cross Street</b>					
West of Livingston Road	806	1,882	70.0%	67.2%	West
West of I-75 Southbound Ramps	1,028	2,311	69.2%	67.3%	West
East of I-75 Northbound Ramps	782	2,088	72.8%	71.2%	West
West of Logan Boulevard	628	2,285	78.4%	76.6%	West
East of Logan Boulevard	408	1,429	77.8%	75.4%	West
<b>Along Side Streets</b>					
Meridian Plaza, east of Livingston Road	74	68	52.1%	58.4%	East
Livingston Road, north of Pine Ridge Road	983	1,209	55.2%	55.8%	South
Livingston Road, south of Pine Ridge Road	962	1,209	55.7%	52.2%	South
Whippoorwill Ln, south of Pine Ridge Road	549	304	64.4%	59.1%	North
Logan Boulevard, north of Pine Ridge Road	447	474	51.5%	53.6%	South
Logan Boulevard, south of Pine Ridge Road	1,313	770	63.0%	61.0%	North

\*Resulting D Factor after volume balancing procedures were conducted.

**Table 2.5: Field Measured D Factors – PM Peak Hour**

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
<b>Along Cross Street</b>					
West of Livingston Road	2,116	1,392	60.3%	59.8%	East
West of I-75 Southbound Ramps	2,353	1,439	62.1%	61.3%	East
East of I-75 Northbound Ramps	1,957	1,128	63.4%	63.4%	East
West of Logan Boulevard	1,937	999	66.0%	65.5%	East
East of Logan Boulevard	1,198	514	70.0%	69.9%	East
<b>Along Side Streets</b>					
Meridian Plaza, east of Livingston Road	59	60	50.4%	50.0%	West
Livingston Road, north of Pine Ridge Road	1,250	953	56.7%	57.2%	North
Livingston Road, south of Pine Ridge Road	1,318	942	58.3%	57.8%	North
Whippoorwill Lane, south of Pine Ridge Road	486	507	51.1%	51.9%	South
Logan Boulevard, north of Pine Ridge Road	565	530	51.6%	51.8%	North
Logan Boulevard, south of Pine Ridge Road	1,061	1,246	54.0%	53.6%	South

\*Resulting D Factor after volume balancing procedures were conducted.

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceed the recommended D factors defined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 76.6 percent was used.

2.2.4 Daily and Design Hour Truck Factors

The daily truck ( $T_{24}$ ) factor is the percentage of medium and heavy truck traffic in a 24-hour period. **Table 2.6** summarizes the classification counts collected as a part of this study effort. These counts were collected during February and March 2019.

**Table 2.6: Field Measured Daily Vehicle Composition**

Location	Total Vehicles	Medium Trucks		Heavy Trucks		Total Trucks ( $T_{24}$ )	
		Count	%	Count	%	Count	%
Pine Ridge Road, west of Logan Boulevard	34,591	2,013	5.8%	99	0.3%	2,112	6.1%

**Table 2.7** summarizes the historical AADT and  $T_{24}$  factors for classification counts in the study area found on Florida Traffic Online (FTO).

Table 2.7: Historical AADT and T<sub>24</sub> Factors

Location	COSITE	2017		2018		2019	
		AADT	T <sub>24</sub>	AADT	T <sub>24</sub>	AADT	T <sub>24</sub>

NB Off Ramp	37021	5500	6.2	5300	9.1	5500	7.5
SB Off Ramp	37024	13500	6.2	11000	9.1	11500	7.5
NB On Ramp	37023	11500	6.2	11000	9.1	11500	7.5

To develop design truck factors for the study area Florida Traffic Online and the 72-hour classification count were reviewed for each major segment group within the study area. If a 72-hour classification count is available it was used, otherwise Florida Traffic Online was used. **Table 2.8** provides the T<sub>24</sub> and design hourly truck factor (DHT) for each of these locations.

Table 2.8: Design Truck Factors

Location	Count Site	T <sub>24</sub>	DHT
I-75 Ramps	FTO count	7.5	4.0
Cross Street	72-hour classification count	6.1	4.0
Side Streets	34575	4.7	3.0

## 1.0 Traffic Data Collection

Traffic counts were collected by FTE, Inc. during February, and March 2019. There were two 72-hour bi-directional classification count, nine 72-hour bi-directional volume counts, and nine turning movement counts (TMCs) collected between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. **Table 1.1** provides a list of all data collection efforts. An analysis of these counts indicates the AM peak hour occurred between 7:15 AM and 8:15 AM and the PM peak hour occurred between 4:45 PM and 5:45 PM.

**Table 1.1: Traffic Data Collection**

Location	Type of Count
<b><i>I-75 Ramps</i></b>

## 2.0 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the Existing Year (2019) design traffic volumes for the interchange study area. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*.

### 2.1 Field Collected AADT

Existing Year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the three-day average of the 72-hour count data by seasonal and axle adjustment factors. Seasonal and axle correction factors were downloaded from Florida Traffic Online, prior to the release of the 2019 data. A comparison of the 2018 seasonal and axle correction factors to the recently released 2019 data indicates only minimal differences and so the 2018 correction factors were not updated to 2019. **Table 2.1** summarizes the field collected Existing Year (2019) AADT volumes.

**Table 2.1: Field Collected Existing Year (2019) AADT**

Location	2019 Count	Seasonal Factor	Axle Factor	2019 AADT	2019 AADT (Rounded)**
<b>I-75 Ramps</b>					
Southbound On-Ramp	2,700	0.86	0.98	2,276	2,300
Northbound Off-Ramp	2,610	0.86	0.98	2,200	2,200
I-75 Northbound On-Ramp from EB Golden Gate Parkway	11,518	0.86	0.98	9,707	9,700
I-75 Northbound On-Ramp from WB Golden Gate Parkway	8,342	0.86	0.98	7,031	7,000
Southbound Off-Ramp	22,295	0.86	0.98	18,790	19,000
<b>Along Cross Street</b>					
Golden Gate Parkway, east of Livingston Road	58,519	0.86	N/A	50,326	50,500
Golden Gate Parkway, east of I-75	40,458	0.86	N/A	34,794	35,000
Golden Gate Parkway, west of Livingston Road	49,376	0.86	0.98	41,614	41,500
Golden Gate Parkway, west of I-75 SB Ramps	61,996	0.86	0.98	52,250	52,500
<b>Along Side Streets</b>					
Livingston Road, south of Golden Gate Parkway	34,244	0.86	0.98	28,861	29,000
Livingston Road, north of Golden Gate Parkway	25,504	0.86	0.98	21,495	21,500

\*This count was a vehicle classification count.

\*\*AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

### 2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT's *Project Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the Existing Year (2019), Opening Year (2025), and Design Year (2040) design traffic volumes.

2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured at each intersection within the study area was used for the Existing Year (2019) for the AM and PM peak hours. **Table 2.2** summarizes the existing AM and PM PHFs for the 9 intersections in the study area. During the AM peak hour, the PHF ranges from 0.83 to 0.97 with a weighted average of 0.92. During the PM peak hour, the PHF ranges from 0.93 to 0.99 with a weighted average of 0.96.

**Table 2.2: Field Measured Peak Hour Factors**

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
Golden Gate Parkway and Livingston Road	0.97	0.99
Golden Gate Parkway and 68th Street	0.97	0.98
Golden Gate Parkway and 66th Street	0.94	0.96
Golden Gate Parkway and 55th Street	0.85	0.93
Golden Gate Parkway and I-75 SB Ramps	0.95	0.98
Golden Gate Parkway and 53rd Street	0.83	0.94
Golden Gate Parkway and I-75 NB Ramps	0.94	0.97
Golden Gate Parkway and 60th Street	0.92	0.96
Golden Gate Parkway and 58th Street	0.89	0.94
<b>Average</b>	<b>0.92</b>	<b>0.96</b>

However, a PHF of 0.96 is recommended for Opening Year (2025) and Design Year (2040) analysis.

2.2.2 Peak to Daily Ratio

The peak to daily ratio (PTD) represents the proportion of AADT occurring during the design hour. **Table 2.3** summarizes the PTD that occurred during the AM and PM peak hours. The weighted average of the AM PTD is 7.8 percent. The weighted average of the PM PTD is 8.3 percent. Based on the FDOT’s *Project Traffic Forecasting Handbook (2019)*, a standard PTD of 9.0 percent is used for arterials in an urban area. The slightly lower PTD observed during the data collection would indicate some amount of congestion and possibly peak spreading. The PTD listed in **Table 2.3** was used in the development of exiting traffic volumes but the standard PTD of 9.0 percent will be used for the future traffic.

Table 2.3: Field Measured Peak to Daily Ratio

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	PTD	Volume	PTD
<b>I-75 Ramps</b>					
Southbound On-Ramp	2,276	103	4.5%	165	7.2%
Northbound Off-Ramp	2,200	160	7.3%	158	7.2%
I-75 Northbound On-Ramp from EB Golden Gate Parkway	9,707	480	4.9%	1,106	11.4%
I-75 Northbound On-Ramp from WB Golden Gate Parkway	7,031	611	8.7%	501	7.1%
Southbound Off-Ramp	18,790	1,744	9.3%	1,130	6.0%
<b>Along Cross Street</b>					
Golden Gate Parkway, east of Livingston Road	50,326	3,758	7.5%	4,052	8.1%
Golden Gate Parkway, east of I-75	34,794	2,819	8.1%	3,185	9.2%
Golden Gate Parkway, west of Livingston Road	41,614	3,098	7.4%	3,508	8.4%
Golden Gate Parkway, west of I-75 SB Ramps	52,250	3,632	7.0%	3,887	7.4%
<b>Along Side Streets</b>					
Livingston Road, south of Golden Gate Parkway	28,861	2,728	9.5%	2,531	8.8%
Livingston Road, north of Golden Gate Parkway	21,495	1,956	9.1%	1,999	9.3%

2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was calculated from the 72-hour bi-directional approach counts for each counted location within the study area. **Tables 2.5** and **2.6** summarize the AM and PM peak hour directional distribution percentages (D factors) for this interchange. The D factor ranged from 68.7 percent to 78.1 percent during the AM peak hour along the cross street, with a peak direction of west throughout. During the PM peak hour, the D factors are not quite as extreme on the cross street, but still high with an east peak direction.

Table 2.4: Field Measured D Factors – AM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
<b>Along Cross Street</b>					
Golden Gate Parkway, east of Livingston Road	985	2,773	73.8%	74.7%	West
Golden Gate Parkway, east of I-75	861	1,958	69.5%	68.7%	West
Golden Gate Parkway, west of Livingston Road	714	2,384	77.0%	78.1%	West
Golden Gate Parkway, west of I-75 SB Ramps	977	2,655	73.1%	74.4%	West
<b>Along Side Streets</b>					
Livingston Road, south of Golden Gate Parkway	1,223	1,505	55.2%	56.1%	South
Livingston Road, north of Golden Gate Parkway	817	1,139	58.2%	57.2%	South

\*Resulting D Factor after volume balancing procedures were conducted.

Table 2.5: Field Measured D Factors – PM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
<b>Along Cross Street</b>					
Golden Gate Parkway, east of Livingston Road	2,594	1,458	64.0%	64.1%	East
Golden Gate Parkway, east of I-75	1,993	1,192	62.6%	62.5%	East
Golden Gate Parkway, west of Livingston Road	2,322	1,186	66.2%	66.3%	East
Golden Gate Parkway, west of I-75 SB Ramps	2,587	1,300	66.6%	65.3%	East
<b>Along Side Streets</b>					
Livingston Road, south of Golden Gate Parkway	1,428	1,103	56.4%	57.3%	North
Livingston Road, north of Golden Gate Parkway	1,174	825	58.7%	61.2%	North

\*Resulting D Factor after volume balancing procedures were conducted.

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceed the recommended D factors defined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 78.1 percent was used.

### 2.2.4 Daily and Design Hour Truck Factors

The daily truck ( $T_{24}$ ) factor is the percentage of medium and heavy truck traffic in a 24-hour period. **Table 2.6** summarizes the classification counts collected as a part of this study effort. These counts were collected during February and March 2019.

Table 2.6: Field Measured Daily Vehicle Composition

Location	Total Vehicles	Medium Trucks		Heavy Trucks		Total Trucks ( $T_{24}$ )	
		Count	%	Count	%	Count	%
Golden Gate Parkway, east of Livingston Road	50,093	2,782	5.6%	581	1.2%	3,363	6.7%
Golden Gate Parkway, east of I-75	36,528	1,680	4.6%	110	0.3%	1,790	4.9%

**Table 2.7** summarizes the historical AADT and  $T_{24}$  factors for classification counts in the study area found on Florida Traffic Online (FTO).

Table 2.7: Historical AADT and  $T_{24}$  Factors

Location	COSITE	2017		2018		2019	
		AADT	$T_{24}$	AADT	$T_{24}$	AADT	$T_{24}$
NB Off Ramp	37035	1800	6.4	2200	9.1	2300	7.5
NB On Ramp	37039	7600	6.4	7100	9.1	7300	7.5

SB Off Ramp	37037	21000	6.4	19000	9.1	19500	7.5
SB On Ramp	37036	2100	6.4	2200	9.1	2300	7.5
Livingstone Road, south of Golden Gate Parkway	34687	31000	6.6	33000	7.7	32500	7.4
Santa Barbara Boulevard, north of Golden Gate Parkway	34529	23500	3.8	26000	4.9	27000	4.3

## Golden Gate Parkway

To develop design truck factors for the study area Florida Traffic Online and the 72-hour classification count were reviewed for each major segment group within the study area. If a 72-hour classification count is available it was used, otherwise Florida Traffic Online was used. **Table 2.8** provides the  $T_{24}$  and design hourly truck factor (DHT) for each of these locations.

**Table 2.8: Design Truck Factors**

Location	Count Site	$T_{24}$	DHT
I-75 Ramps	FTO count	7.5	4
Cross Street	72-hour classification count	6.7	4
Side Streets	34687	7.4	4

## 1.0 Traffic Data Collection

Traffic counts were collected by FTE, Inc. during February, and March 2019. There were three 72-hour bi-directional volume counts, and four turning movement counts (TMCs) collected between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. **Table 1.1** provides a list of all data collection efforts. An analysis of these counts indicates the AM peak hour occurred between 7:15 AM and 8:15 AM and the PM peak hour occurred between 4:45 PM and 5:45 PM.

**Table 1.1: Traffic Data Collection**

Location	Type of Count
<b><i>Along Cross Street</i></b>	
Santa Barbara Boulevard, north of Golden Gate Parkway	72-Hour Volume Count
Santa Barbara Boulevard, south of Golden Gate Parkway	72-Hour Volume Count
<b><i>Along Side Streets</i></b>	
Golden Gate Parkway, east of Santa Barbara Boulevard	72-Hour Volume Count
<b><i>Intersections</i></b>	
Radio Road and Santa Barbara Boulevard	Turning Movement Count

Santa Barbara Boulevard and Painted Leaf Ln	Turning Movement Count
Santa Barbara Boulevard and Recreation Ln	Turning Movement Count

## 2.0 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the Existing Year (2019) design traffic volumes for the interchange study area. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*.

### 2.1 Field Collected AADT

Existing Year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the three-day average of the 72-hour count data by seasonal and axle adjustment factors. Seasonal and axle correction factors were downloaded from Florida Traffic Online, prior to the release of the 2019 data. A comparison of the 2018 seasonal and axle correction factors to the recently released 2019 data indicates only minimal differences and so the 2018 correction factors were not updated to 2019. **Table 2.1** summarizes the field collected Existing Year (2019) AADT volumes.

**Table 2.1: Field Collected Existing Year (2019) AADT**

Location	2019 Count	Seasonal Factor	Axle Factor	2019 AADT	2019 AADT (Rounded)**
<b>Along Cross Street</b>					
Santa Barbara Boulevard, north of Golden Gate Parkway	23,616	0.87	0.98	20,135	20,000
Santa Barbara Boulevard, south of Golden Gate Parkway	42,486	0.87	0.98	36,224	36,000
<b>Along Side Streets</b>					
Golden Gate Parkway, east of Santa Barbara Boulevard	29,488	0.87	0.98	25,141	25,000

\*This count was a vehicle classification count.

\*\*AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

### 2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the Existing Year (2019), Opening Year (2025), and Design Year (2040) design traffic volumes.

#### 2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured at each intersection within the study area was used for the Existing Year (2019) for the AM and PM peak hours. **Table 2.2** summarizes the existing AM and PM PHFs for the 4 intersections in the study area. During the AM peak hour, the PHF ranges from 0.86 to 0.94 with a weighted average of 0.90. During the PM peak hour, the PHF ranges from 0.95 to 0.96 with a weighted average of 0.95.

**Table 2.2: Field Measured Peak Hour Factors**

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
Radio Road and Santa Barbara Boulevard	0.86	0.95
Santa Barbara Boulevard and Painted Leaf Ln	0.94	0.95
Santa Barbara Boulevard and Golden Gate Parkway	0.92	0.96
Santa Barbara Boulevard and Recreation Ln	0.89	0.95
<b>Average</b>	<b>0.90</b>	<b>0.95</b>

However, a PHF of 0.95 is recommended for Opening Year (2025) and Design Year (2040) analysis.

### 2.2.2 Peak to Daily Ratio

The peak to daily ratio (PTD) represents the proportion of AADT occurring during the design hour. **Table 2.3** summarizes the PTD that occurred during the AM and PM peak hours. The weighted average of the AM PTD is 8.3 percent. The weighted average of the PM PTD is 8.9 percent. Based on the FDOT's *Project Traffic Forecasting Handbook (2019)*, a standard PTD of 9.0 percent is used for arterials in an urban area. The slightly lower PTD observed during the data collection would indicate some amount of congestion and possibly peak spreading. The PTD listed in **Table 2.3** was used in the development of exiting traffic volumes but the standard PTD of 9.0 percent will be used for the future traffic.

Table 2.3: Field Measured Peak to Daily Ratio

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	PTD	Volume	PTD
<b>Along Cross Street</b>					
Santa Barbara Boulevard, north of Golden Gate Parkway	20,135	1,968	9.8%	2,087	10.4%
Santa Barbara Boulevard, south of Golden Gate Parkway	36,224	2,763	7.6%	2,991	8.3%
<b>Along Side Streets</b>					
Golden Gate Parkway, east of Santa Barbara Boulevard	25,141	2,044	8.1%	2,137	8.5%

2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was calculated from the 72-hour bi-directional approach counts for each counted location within the study area. **Tables 2.5** and **2.6** summarize the AM and PM peak hour directional distribution percentages (D factors) for this interchange. The D factor ranged from 54.7 percent to 66.7 percent during the AM peak hour along the cross street, with a peak direction of south throughout. During the PM peak hour, the D factor ranged from 55.6 percent to 65.7 with a north peak direction.

Table 2.4: Field Measured D Factors – AM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
<b>Along Cross Street</b>					
Santa Barbara Boulevard, north of Golden Gate Parkway	683	1,285	65.3%	66.7%	South
Santa Barbara Boulevard, south of Golden Gate Parkway	1,256	1,507	54.5%	54.7%	South
<b>Along Side Streets</b>					
Golden Gate Parkway, east of Santa Barbara Boulevard	672	1,372	67.1%	66.5%	West

\*Resulting D Factor after volume balancing procedures were conducted.

Table 2.5: Field Measured D Factors – PM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
<b>Along Cross Street</b>					
Santa Barbara Boulevard, north of Golden Gate Parkway	1,312	775	62.9%	65.7%	North
Santa Barbara Boulevard, south of Golden Gate Parkway	1,655	1,336	55.3%	55.6%	North
<b>Along Side Streets</b>					
Golden Gate Parkway, east of Santa Barbara Boulevard	1,276	861	59.7%	60.3%	East

\*Resulting D Factor after volume balancing procedures were conducted.

## Santa Barbara Boulevard

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceed the recommended D factors defined in the FDOT's *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 66.7 percent was used.

### 2.2.4 Daily and Design Hour Truck Factors

The daily truck ( $T_{24}$ ) factor is the percentage of medium and heavy truck traffic in a 24-hour period. There were no classification counts collected in this study area and no design truck factors for the study area from Florida Traffic Online.

## 1.0 Traffic Data Collection

Traffic counts were collected by FTE, Inc. during February, and March 2019. There were two 72-hour bi-directional classification count, seven 72-hour bi-directional volume counts, and eleven turning movement counts (TMCs) collected between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. **Table 1.1** provides a list of all data collection efforts. An analysis of these counts indicates the AM peak hour occurred between 7:15 AM and 8:15 AM and the PM peak hour occurred between 4:45 PM and 5:45 PM.

**Table 1.1: Traffic Data Collection**

## 2.0 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the Existing Year (2019) design traffic volumes for the interchange study area. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*.

### 2.1 Field Collected AADT

Existing Year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the three-day average of the 72-hour count data by seasonal and axle adjustment factors. Seasonal and axle correction factors were downloaded from Florida Traffic Online, prior to the release of the 2019 data. A comparison of the 2018 seasonal and axle correction factors to the recently released 2019 data indicates only minimal differences and so the 2018 correction factors were not updated to 2019. **Table 2.1** summarizes the field collected Existing Year (2019) AADT volumes.

**Table 2.1: Field Collected Existing Year (2019) AADT**

Location	2019 Count	Seasonal Factor	Axle Factor	2019 AADT	2019 AADT (Rounded)**
<b><i>I-75 Ramps</i></b>					
Southbound Off-Ramp	17,208	0.87	0.98	14,672	14,500
Southbound On-Ramp	2,420	0.87	0.98	2,063	2,100
Northbound Off-Ramp	2,774	0.87	0.98	2,365	2,400
Northbound On-Ramp	15,765	0.87	0.98	13,441	13,500
<b><i>Along Cross Street</i></b>					
Collier Boulevard, north of Davis Boulevard	56,018	0.87	0.98	47,761	48,000
<b><i>Along Side Streets</i></b>

Santa Barbara Boulevard, south of Radio Road	33,361	0.87	N/A	29,024	29,000
Beck Boulevard, east of Collier Boulevard	8,876	0.87	0.98	7,568	7,600
Davis Boulevard, south of Radio Road	15,824	0.87	0.98	13,492	13,500
Golden Gate Parkway, west of Collier Boulevard	20,245	0.87	0.98	17,261	17,500

\*This count was a vehicle classification count.

\*\*AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

### 2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the Existing Year (2019), Opening Year (2025), and Design Year (2040) design traffic volumes.

#### 2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured at each intersection within the study area was used for the Existing Year (2019) for the AM and PM peak hours. **Table 2.2** summarizes the existing AM and PM PHFs for the 11 intersections in the study

## Collier Boulevard

area. During the AM peak hour, the PHF ranges from 0.92 to 0.97 with a weighted average of 0.95. During the PM peak hour, the PHF ranges from 0.90 to 0.98 with a weighted average of 0.95.

**Table 2.2: Field Measured Peak Hour Factors**

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
Collier Boulevard and 25th Avenue	0.96	0.95
Collier Boulevard and Golden Gate Parkway	0.96	0.96
Collier Boulevard and Business Cir S	0.94	0.92
Radio Road and Madison Park Boulevard	0.92	0.95
Radio Road and Davis Boulevard	0.92	0.96
Davis Boulevard and Market Street	0.95	0.90
Collier Boulevard and Davis Boulevard	0.98	0.95
Collier Boulevard and I-75 SB Ramps	0.96	0.94
Collier Boulevard and I-75 NB Ramps	0.96	0.98
Collier Boulevard and City Gate Drive	0.97	0.95
Collier Boulevard and South Florida Water Management DistriCourt	0.96	0.95
<b>Average</b>	<b>0.95</b>	<b>0.95</b>

However, a PHF of 0.95 is recommended for Opening Year (2025) and Design Year (2040) analysis.

### 2.2.2 Peak to Daily Ratio

The peak to daily ratio (PTD) represents the proportion of AADT occurring during the design hour. **Table 2.3** summarizes the PTD that occurred during the AM and PM peak hours. The weighted average of the AM PTD is 7.4 percent. The weighted average of the PM PTD is 8.4 percent. Based on the FDOT's *Project Traffic Forecasting Handbook (2019)*, a standard PTD of 9.0 percent is used for arterials in an urban area. The slightly lower PTD observed during the data collection would indicate some amount of congestion and possibly peak spreading. The PTD listed in **Table 2.3** was used in the development of exiting traffic volumes but the standard PTD of 9.0 percent will be used for the future traffic.

Table 2.3: Field Measured Peak to Daily Ratio

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	PTD	Volume	PTD
<b>I-75 Ramps</b>					
Southbound Off-Ramp	14,672	1,037	7.1%	990	6.7%
Southbound On-Ramp	2,063	115	5.6%	137	6.6%
Northbound Off-Ramp	2,365	143	6.0%	158	6.7%
Northbound On-Ramp	13,441	831	6.2%	1,021	7.6%
<b>Along Cross Street</b>					
Collier Boulevard, north of Davis Boulevard	47,761	3,710	7.8%	4,087	8.6%
<b>Along Side Streets</b>					
Radio Road, west of Santa Barbara Boulevard	22,215	1,642	7.4%	1,933	8.7%
Santa Barbara Boulevard, south of Radio Road	29,024	2,310	8.0%	2,754	9.5%
Beck Boulevard, east of Collier Boulevard	7,568	559	7.4%	639	8.4%
Davis Boulevard, south of Radio Road	13,492	971	7.2%	1,041	7.7%
Golden Gate Parkway, west of Collier Boulevard	17,261	1,228	7.1%	1,445	8.4%

2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was calculated from the 72-hour bi-directional approach counts for each counted location within the study area. **Tables 2.5** and **2.6** summarize the AM and PM peak hour directional distribution percentages (D factors) for this interchange. The D factor is 64.5 percent during the AM peak hour along the cross street, with a peak direction of south throughout. The PM peak hour shows a D factor of 56.3 percent with a north peak direction.

Table 2.4: Field Measured D Factors – AM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
<b>Along Cross Street</b>					
Collier Boulevard, north of Davis Boulevard	1,326	2,384	64.3%	64.5%	South
<b>Along Side Streets</b>					
Radio Road, west of Santa Barbara Boulevard	654	988	60.2%	58.1%	West
Santa Barbara Boulevard, south of Radio Road	978	1,332	57.7%	57.2%	South
Beck Boulevard, east of Collier Boulevard	329	230	58.9%	59.6%	East
Davis Boulevard, south of Radio Road	300	671	69.1%	68.8%	South
Golden Gate Parkway, west of Collier Boulevard	654	574	53.3%	54.1%	East

\*Resulting D Factor after volume balancing procedures were conducted.

Table 2.5: Field Measured D Factors – PM Peak Hour

Location	Northbound/ Eastbound Volume	Southbound/ Westbound Volume	Field Data D Factor	Balanced D Factor*	Peak Direction
<b>Along Cross Street</b>					
Collier Boulevard, north of Davis Boulevard	2,341	1,746	57.3%	56.3%	North

<b>Along Side Streets</b>					
Radio Road, west of Santa Barbara Boulevard	1,171	762	60.6%	62.4%	East
Santa Barbara Boulevard, south of Radio Road	1,420	1,334	51.6%	51.5%	North
Beck Boulevard, east of Collier Boulevard	298	341	53.4%	53.9%	West
Davis Boulevard, south of Radio Road	600	441	57.6%	56.1%	North
Golden Gate Parkway, west of Collier Boulevard	685	760	52.6%	51.0%	West

\*Resulting D Factor after volume balancing procedures were conducted.

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceed the recommended D factors defined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 67.1 percent was used.

### 2.2.4 Daily and Design Hour Truck Factors

The daily truck ( $T_{24}$ ) factor is the percentage of medium and heavy truck traffic in a 24-hour period. **Table 2.6** summarizes the classification counts collected as a part of this study effort. These counts were collected during February and March 2019.

**Table 2.6: Field Measured Daily Vehicle Composition**

Location	Total Vehicles	Medium Trucks		Heavy Trucks		Total Trucks ( $T_{24}$ )	
		Count	%	Count	%	Count	%
Radio Road, west of Santa Barbara Boulevard	21,949	1,164	5.3%	168	0.8%	1,332	6.1%
Santa Barbara Boulevard, south of Radio Road	32,162	1,319	4.1%	86	0.3%	1,405	4.4%

**Table 2.7** summarizes the historical AADT and  $T_{24}$  factors for classification counts in the study area found on Florida Traffic Online (FTO).

**Table 2.7: Historical AADT and  $T_{24}$  Factors**

Location	COSITE	2017		2018		2019	
		AADT	$T_{24}$	AADT	$T_{24}$	AADT	$T_{24}$
Collier Boulevard, north of Business Circle	34601	39500	6.6	39500	9.4	42000	4.8
Collier Boulevard, north of City Gate Boulevard	34523	27000	7.4	32000	9.6	32000	7.2
Collier Boulevard, north of Golden Gate Parkway	34525	31000	4.5	33500	9.1	34500	7.4
Collier Boulevard, north of SR 84	30190	48000	6.2	48500	9	58000	7.6
Davis Boulevard, west of CR 951	30193	22000	5.3	24500	8.3	24500	5.5
